- `statement/com/Error` accounts for messages received by the server that are out of band. It can be used to detect commands sent by clients that the server does not understand. This may be helpful for purposes such as identifying clients that are misconfigured or using a version of MySQL more recent than that of the server, or clients that are attempting to attack the server.
- `statement/sql/error` accounts for SQL statements that fail to parse. It can be used to detect malformed queries sent by clients. A query that fails to parse differs from a query that parses but fails due to an error during execution. For example, `SELECT * FROM` is malformed, and the `statement/sql/error` instrument is used. By contrast, `SELECT *` parses but fails with a `No tables used` error. In this case, `statement/sql/select` is used and the statement event contains information to indicate the nature of the error.

A request can be obtained from any of these sources:

- As a command or statement request from a client, which sends the request as packets
- As a statement string read from the relay log on a replication slave
- As an event from the Event Scheduler

The details for a request are not initially known and the Performance Schema proceeds from abstract to specific instrument names in a sequence that depends on the source of the request.

For a request received from a client:

1. When the server detects a new packet at the socket level, a new statement is started with an abstract instrument name of `statement/abstract/new_packet`.
2. When the server reads the packet number, it knows more about the type of request received, and the Performance Schema refines the instrument name. For example, if the request is a `COM_PING` packet, the instrument name becomes `statement/com/Ping` and that is the final name. If the request is a `COM_QUERY` packet, it is known to correspond to an SQL statement but not the particular type of statement. In this case, the instrument changes from one abstract name to a more

specific but still abstract name, `statement/abstract/Query`, and the request requires further classification.

3. If the request is a statement, the statement text is read and given to the parser. After parsing, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

For a request read as a statement from the relay log on a replication slave:

1. Statements in the relay log are stored as text and are read as such. There is no network protocol, so the `statement/abstract/new_packet` instrument is not used. Instead, the initial instrument is `statement/abstract/relay_log`.

2. When the statement is parsed, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

The preceding description applies only for statement-based replication. For row-based replication, table I/O done on the slave as it processes row changes can be instrumented, but row events in the relay log do not appear as discrete statements.

For a request received from the Event Scheduler:

The event execution is instrumented using the name `statement/scheduler/event`. This is the final name.

Statements executed within the event body are instrumented using `statement/sql/*` names, without use of any preceding abstract instrument. An event is a stored program, and stored programs are precompiled in memory before execution. Consequently, there is no parsing at runtime and the type of each statement is known by the time it executes.

Statements executed within the event body are child statements. For example, if an event executes an `INSERT` statement, execution of the event itself is the parent, instrumented using `statement/scheduler/event`, and the `INSERT` is the child, instrumented using `statement/sql/insert`. The parent/child relationship holds *between* separate instrumented operations. This differs from the sequence of refinement that occurs *within* a single instrumented operation, from abstract to final instrument names.

For statistics to be collected for statements, it is not sufficient to enable only the final `statement/sql/*` instruments used for individual statement types. The abtract `statement/abstract/*` instruments must be enabled as well. This should not normally be an issue because all statement instruments are enabled by default. However, an application that enables or disables statement instruments selectively must take into account that disabling abstract instruments also disables statistics collection for the individual statement instruments. For example, to collect statistics for `INSERT` statements, `statement/sql/insert` must be enabled, but also `statement/abstract/new_packet` and `statement/abstract/Query`. Similarly, for replicated statements to be instrumented, `statement/abstract/relay_log` must be enabled.

No statistics are aggregated for abstract instruments such as `statement/abstract/Query` because no statement is ever classified with an abstract instrument as the final statement name.

25.11.6.1 The events_statements_current Table

The `events_statements_current` table contains current statement events, one row per thread showing the current status of the thread's most recent monitored statement event.

Of the tables that contain statement event rows, `events_statements_current` is the most fundamental. Other tables that contain statement event rows are logically derived from the current events. For example, the `events_statements_history` and

`events_statements_history_long` tables are collections of the most recent statement events, up to a fixed number of rows.

For information about configuration of statement event collection, see Section 25.11.6, “Performance Schema Statement Event Tables”.

The `events_statements_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

  The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

  This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

  The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 25.6, “Performance Schema Instrument Naming Conventions”.

  For SQL statements, the `EVENT_NAME` value initially is `statement/com/Query` until the statement is parsed, then changes to a more appropriate value, as described in Section 25.11.6, “Performance Schema Statement Event Tables”.

- `SOURCE`

  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

  If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END` − `TIMER_START`).

  If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

  For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 25.4.1, “Performance Schema Event Timing”.

- `LOCK_TIME`

  The time spent waiting for table locks. This value is computed in microseconds but normalized to picoseconds for easier comparison with other Performance Schema timers.

- `SQL_TEXT`

  The text of the SQL statement. For a command not associated with an SQL statement, the value is `NULL`.

  The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup.

(Changing this value affects columns in other Performance Schema tables as well. See Section 25.9, “Performance Schema Statement Digests and Sampling”.)

- `DIGEST`

  The statement digest MD5 value as a string of 32 hexadecimal characters, or `NULL` if the `statements_digest` consumer is `no`. For more information about statement digesting, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

- `DIGEST_TEXT`

  The normalized statement digest text, or `NULL` if the `statements_digest` consumer is `no`. For more information about statement digesting, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

  The `performance_schema_max_digest_length` system variable determines the maximum number of bytes available for digest value storage. However, the display length of statement digests may be longer than the available buffer size due to encoding of statement components such as keywords and literal values in digest buffer. Consequently, values selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

- `CURRENT_SCHEMA`

  The default database for the statement, `NULL` if there is none.

- `OBJECT_SCHEMA`, `OBJECT_NAME`, `OBJECT_TYPE`

  For nested statements (stored programs), these columns contain information about the parent statement. Otherwise they are `NULL`.

- `OBJECT_INSTANCE_BEGIN`

  This column identifies the statement. The value is the address of an object in memory.

- `MYSQL_ERRNO`

  The statement error number, from the statement diagnostics area.

- `RETURNED_SQLSTATE`

  The statement SQLSTATE value, from the statement diagnostics area.

- `MESSAGE_TEXT`

  The statement error message, from the statement diagnostics area.

- `ERRORS`

  Whether an error occurred for the statement. The value is 0 if the SQLSTATE value begins with `00` (completion) or `01` (warning). The value is 1 is the SQLSTATE value is anything else.

- `WARNINGS`

  The number of warnings, from the statement diagnostics area.

- `ROWS_AFFECTED`

  The number of rows affected by the statement. For a description of the meaning of “affected,” see Section 27.7.7.1, “mysql_affected_rows()”.

- `ROWS_SENT`

  The number of rows returned by the statement.

- `ROWS_EXAMINED`

  The number of rows read from storage engines during statement execution.

- `CREATED_TMP_DISK_TABLES`

  Like the `Created_tmp_disk_tables` status variable, but specific to the statement.

- `CREATED_TMP_TABLES`

  Like the `Created_tmp_tables` status variable, but specific to the statement.

- `SELECT_FULL_JOIN`

  Like the `Select_full_join` status variable, but specific to the statement.

- `SELECT_FULL_RANGE_JOIN`

  Like the `Select_full_range_join` status variable, but specific to the statement.

- `SELECT_RANGE`

  Like the `Select_range` status variable, but specific to the statement.

- `SELECT_RANGE_CHECK`

  Like the `Select_range_check` status variable, but specific to the statement.

- `SELECT_SCAN`

  Like the `Select_scan` status variable, but specific to the statement.

- `SORT_MERGE_PASSES`

  Like the `Sort_merge_passes` status variable, but specific to the statement.

- `SORT_RANGE`

  Like the `Sort_range` status variable, but specific to the statement.

- `SORT_ROWS`

  Like the `Sort_rows` status variable, but specific to the statement.

- `SORT_SCAN`

  Like the `Sort_scan` status variable, but specific to the statement.

- `NO_INDEX_USED`

  1 if the statement performed a table scan without using an index, 0 otherwise.

- `NO_GOOD_INDEX_USED`

  1 if the server found no good index to use for the statement, 0 otherwise. For additional information, see the description of the `Extra` column from `EXPLAIN` output for the `Range checked for each record` value in Section 8.8.2, “EXPLAIN Output Format”.

- `NESTING_EVENT_ID`, `NESTING_EVENT_TYPE`, `NESTING_EVENT_LEVEL`

  These three columns are used with other columns to provide information as follows for top-level (unnested) statements and nested statements (executed within a stored program).

  For top level statements:

```
OBJECT_TYPE = NULL
OBJECT_SCHEMA = NULL
OBJECT_NAME = NULL
NESTING_EVENT_ID = NULL
NESTING_EVENT_TYPE = NULL
NESTING_LEVEL = 0
```

For nested statements:

```
OBJECT_TYPE = the parent statement object type
OBJECT_SCHEMA = the parent statement object schema
OBJECT_NAME = the parent statement object name
NESTING_EVENT_ID = the parent statement EVENT_ID
NESTING_EVENT_TYPE = 'STATEMENT'
NESTING_LEVEL = the parent statement NESTING_LEVEL plus one
```

The `events_statements_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_statements_current` table. It removes the rows.

25.11.6.2 The events_statements_history Table

The `events_statements_history` table contains the most recent *`N`* statement events per thread. The value of *`N`* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_statements_history_size` system variable at server startup. Statement events are not added to the table until they have ended. As new events are added, older events are discarded if the table is full.

The `events_statements_history` table has the same structure as `events_statements_current`, including indexing. See Section 25.11.6.1, “The events_statements_current Table”.

`TRUNCATE TABLE` is permitted for the `events_statements_history` table. It removes the rows.

For information about configuration of statement event collection, see Section 25.11.6, “Performance Schema Statement Event Tables”.

25.11.6.3 The events_statements_history_long Table

The `events_statements_history_long` table contains the most recent *`N`* statement events. The value of *`N`* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_statements_history_long_size` system variable at server startup. Statement events are not added to the table until they have ended. As new events are added, older events are discarded if the table is full. When a thread ends, its rows are removed from the table.

The `events_statements_history_long` table has the same structure as `events_statements_current`, except that it has no indexes. See Section 25.11.6.1, “The events_statements_current Table”.

`TRUNCATE TABLE` is permitted for the `events_statements_history_long` table. It removes the rows.

For information about configuration of statement event collection, see Section 25.11.6, “Performance Schema Statement Event Tables”.

25.11.6.4 The prepared_statements_instances Table

The Performance Schema provides instrumentation for prepared statements, for which there are two protocols:

- The binary protocol. This is accessed through the MySQL C API and maps onto underlying server commands as shown in the following table.

C API Function	Corresponding Server Command
`mysql_stmt_prepare()`	`COM_STMT_PREPARE`
`mysql_stmt_execute()`	`COM_STMT_EXECUTE`
`mysql_stmt_close()`	`COM_STMT_CLOSE`

- The text protocol. This is accessed using SQL statements and maps onto underlying server commands as shown in the following table.

SQL Statement	Corresponding Server Command
`PREPARE`	`SQLCOM_PREPARE`
`EXECUTE`	`SQLCOM_EXECUTE`
`DEALLOCATE PREPARE`, `DROP PREPARE`	`SQLCOM_DEALLOCATE PREPARE`

Performance Schema prepared statement instrumentation covers both protocols. The following discussion refers to the server commands rather than the C API functions or SQL statements.

Information about prepared statements is available in the `prepared_statements_instances` table. This table enables inspection of prepared statements used in the server and provides aggregated statistics about them. To control the size of this table, set the `performance_schema_max_prepared_statements_instances` system variable at server startup.

Collection of prepared statement information depends on the statement instruments shown in the following table. These instruments are enabled by default. To modify them, update the `setup_instruments` table.

Instrument	Server Command
`statement/com/Prepare`	`COM_STMT_PREPARE`
`statement/com/Execute`	`COM_STMT_EXECUTE`
`statement/sql/prepare_sql`	`SQLCOM_PREPARE`
`statement/sql/execute_sql`	`SQLCOM_EXECUTE`

The Performance Schema manages the contents of the `prepared_statements_instances` table as follows:

- Statement preparation

  A `COM_STMT_PREPARE` or `SQLCOM_PREPARE` command creates a prepared statement in the server. If the statement is successfully instrumented, a new row is added to the `prepared_statements_instances` table. If the statement cannot be instrumented, `Performance_schema_prepared_statements_lost` status variable is incremented.

- Prepared statement execution

  Execution of a `COM_STMT_EXECUTE` or `SQLCOM_PREPARE` command for an instrumented prepared statement instance updates the corresponding `prepared_statements_instances` table row.

- Prepared statement deallocation

  Execution of a `COM_STMT_CLOSE` or `SQLCOM_DEALLOCATE_PREPARE` command for an instrumented prepared statement instance removes the corresponding `prepared_statements_instances` table row. To avoid resource leaks, removal occurs even if the prepared statement instruments described previously are disabled.

The `prepared_statements_instances` table has these columns:

- `OBJECT_INSTANCE_BEGIN`

  The address in memory of the instrumented prepared statement.

- `STATEMENT_ID`

  The internal statement ID assigned by the server. The text and binary protocols both use statement IDs.

- `STATEMENT_NAME`

  For the binary protocol, this column is `NULL`. For the text protocol, this column is the external statement name assigned by the user. For example, for the following SQL statement, the name of the prepared statement is `stmt`:

  ```
  PREPARE stmt FROM 'SELECT 1';
  ```

- `SQL_TEXT`

  The prepared statement text, with `?` placeholder markers.

- `OWNER_THREAD_ID`, `OWNER_EVENT_ID`

  These columns indicate the event that created the prepared statement.

- `OWNER_OBJECT_TYPE`, `OWNER_OBJECT_SCHEMA`, `OWNER_OBJECT_NAME`

  For a prepared statement created by a client session, these columns are `NULL`. For a prepared statement created by a stored program, these columns point to the stored program. A typical user error is forgetting to deallocate prepared statements. These columns can be used to find stored programs that leak prepared statements:

  ```
  SELECT OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME,
  STATEMENT_NAME, SQL_TEXT
  FROM performance_schema.prepared_statements_instances
  WHERE OWNER_OBJECT_TYPE IS NOT NULL;
  ```

- `TIMER_PREPARE`

  The time spent executing the statement preparation itself.

- `COUNT_REPREPARE`

  The number of times the statement was reprepared internally (see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”). Timing statistics for repreparation are not available because it is counted as part of statement execution, not as a separate operation.

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

  Aggregated statistics for executions of the prepared statement.

- `SUM_`*`xxx`*

  The remaining `SUM_`*`xxx`* columns are the same as for the statement summary tables (see Section 25.11.15.3, “Statement Summary Tables”).

The `prepared_statements_instances` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)

- Index on (`STATEMENT_ID`)
- Index on (`STATEMENT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)
- Index on (`OWNER_OBJECT_TYPE`, `OWNER_OBJECT_SCHEMA`, `OWNER_OBJECT_NAME`)

`TRUNCATE TABLE` resets the statistics columns of the `prepared_statements_instances` table.

25.11.7 Performance Schema Transaction Tables

The Performance Schema instruments transactions. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store transaction events:

- `events_transactions_current`: Current transaction events
- `events_transactions_history`: The most recent transaction events per thread
- `events_transactions_history_long`: The most recent transaction events globally (across all threads)

The following sections describe the transaction event tables. There are also summary tables that aggregate information about transaction events; see Section 25.11.15.5, “Transaction Summary Tables”.

Transaction Event Configuration

To control collection of transaction events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains an instrument named `transaction`. Use this instrument to enable or disable collection of transaction events.
- The `setup_consumers` table contains consumer values with names corresponding to the current and recent transaction event table names. Use these consumers to filter collection of transaction events.

The `transaction` instrument and the `events_transactions_current` and `events_transactions_history` transaction consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED FROM setup_instruments
       WHERE NAME = 'transaction';
+-------------+---------+-------+
| NAME        | ENABLED | TIMED |
+-------------+---------+-------+
| transaction | YES     | YES   |
+-------------+---------+-------+
mysql> SELECT * FROM setup_consumers
       WHERE NAME LIKE '%transactions%';
+--------------------------------+---------+
| NAME                           | ENABLED |
+--------------------------------+---------+
| events_transactions_current    | YES     |
| events_transactions_history    | YES     |
| events_transactions_history_long | NO    |
+--------------------------------+---------+
```

To control transaction event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='transaction=ON'
performance-schema-consumer-events-transactions-current=ON
performance-schema-consumer-events-transactions-history=ON
performance-schema-consumer-events-transactions-history-long=ON
```

- Disable:

```
[mysqld]
performance-schema-instrument='transaction=OFF'
performance-schema-consumer-events-transactions-current=OFF
performance-schema-consumer-events-transactions-history=OFF
performance-schema-consumer-events-transactions-history-long=OFF
```

To control transaction event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

```
UPDATE setup_instruments SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'transaction';
UPDATE setup_consumers SET ENABLED = 'YES'
WHERE NAME LIKE '%transactions%';
```

- Disable:

```
UPDATE setup_instruments SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'transaction';
UPDATE setup_consumers SET ENABLED = 'NO'
WHERE NAME LIKE '%transactions%';
```

To collect transaction events only for specific transaction event tables, enable the `transaction` instrument but only the transaction consumers corresponding to the desired tables.

The `setup_timers` table contains a row with a `NAME` value of `transaction` that indicates the unit for transaction event timing. The default unit is `NANOSECOND`:

```
mysql> SELECT * FROM setup_timers WHERE NAME = 'transaction';
+-------------+------------+
| NAME        | TIMER_NAME |
+-------------+------------+
| transaction | NANOSECOND |
+-------------+------------+
```

To change the timing unit, modify the `TIMER_NAME` value:

```
UPDATE setup_timers SET TIMER_NAME = 'MICROSECOND'
WHERE NAME = 'transaction';
```

For additional information about configuring event collection, see Section 25.3, “Performance Schema Startup Configuration”, and Section 25.4, “Performance Schema Runtime Configuration”.

Transaction Boundaries

In MySQL Server, transactions start explicitly with these statements:

```
START TRANSACTION | BEGIN | XA START | XA BEGIN
```

Transactions also start implicitly. For example, when the `autocommit` system variable is enabled, the start of each statement starts a new transaction.

When `autocommit` is disabled, the first statement following a committed transaction marks the start of a new transaction. Subsequent statements are part of the transaction until it is committed.

Transactions explicitly end with these statements:

```
COMMIT | ROLLBACK | XA COMMIT | XA ROLLBACK
```

Transactions also end implicitly, by execution of DDL statements, locking statements, and server administration statements.

In the following discussion, references to `START TRANSACTION` also apply to `BEGIN`, `XA START`, and `XA BEGIN`. Similarly, references to `COMMIT` and `ROLLBACK` apply to `XA COMMIT` and `XA ROLLBACK`, respectively.

The Performance Schema defines transaction boundaries similarly to that of the server. The start and end of a transaction event closely match the corresponding state transitions in the server:

- For an explicitly started transaction, the transaction event starts during processing of the `START TRANSACTION` statement.
- For an implicitly started transaction, the transaction event starts on the first statement that uses a transactional engine after the previous transaction has ended.
- For any transaction, whether explicitly or implicitly ended, the transaction event ends when the server transitions out of the active transaction state during the processing of `COMMIT` or `ROLLBACK`.

There are subtle implications to this approach:

- Transaction events in the Performance Schema do not fully include the statement events associated with the corresponding `START TRANSACTION`, `COMMIT`, or `ROLLBACK` statements. There is a trivial amount of timing overlap between the transaction event and these statements.
- Statements that work with nontransactional engines have no effect on the transaction state of the connection. For implicit transactions, the transaction event begins with the first statement that uses a transactional engine. This means that statements operating exclusively on nontransactional tables are ignored, even following `START TRANSACTION`.

To illustrate, consider the following scenario:

```
1. SET autocommit = OFF;
2. CREATE TABLE t1 (a INT) ENGINE = InnoDB;
3. START TRANSACTION;                       -- Transaction 1 START
4. INSERT INTO t1 VALUES (1), (2), (3);
5. CREATE TABLE t2 (a INT) ENGINE = MyISAM; -- Transaction 1 COMMIT
                                            -- (implicit; DDL forces commit)
6. INSERT INTO t2 VALUES (1), (2), (3);     -- Update nontransactional table
7. UPDATE t2 SET a = a + 1;                 -- ... and again
8. INSERT INTO t1 VALUES (4), (5), (6);     -- Write to transactional table
                                            -- Transaction 2 START (implicit)
9. COMMIT;                                  -- Transaction 2 COMMIT
```

From the perspective of the server, Transaction 1 ends when table `t2` is created. Transaction 2 does not start until a transactional table is accessed, despite the intervening updates to nontransactional tables.

From the perspective of the Performance Schema, Transaction 2 starts when the server transitions into an active transaction state. Statements 6 and 7 are not included within the boundaries of Transaction 2, which is consistent with how the server writes transactions to the binary log.

Transaction Instrumentation

Three attributes define transactions:

- Access mode (read only, read write)
- Isolation level (`SERIALIZABLE`, `REPEATABLE READ`, and so forth)
- Implicit (`autocommit` enabled) or explicit (`autocommit` disabled)

To reduce complexity of the transaction instrumentation and to ensure that the collected transaction data provides complete, meaningful results, all transactions are instrumented independently of access mode, isolation level, or autocommit mode.

To selectively examine transaction history, use the attribute columns in the transaction event tables: `ACCESS_MODE`, `ISOLATION_LEVEL`, and `AUTOCOMMIT`.

The cost of transaction instrumentation can be reduced various ways, such as enabling or disabling transaction instrumentation according to user, account, host, or thread (client connection).

Transactions and Nested Events

The parent of a transaction event is the event that initiated the transaction. For an explicitly started transaction, this includes the `START TRANSACTION` and `COMMIT AND CHAIN` statements. For an implicitly started transaction, it is the first statement that uses a transactional engine after the previous transaction ends.

In general, a transaction is the top-level parent to all events initiated during the transaction, including statements that explicitly end the transaction such as `COMMIT` and `ROLLBACK`. Exceptions are statements that implicitly end a transaction, such as DDL statements, in which case the current transaction must be committed before the new statement is executed.

Transactions and Stored Programs

Transactions and stored program events are related as follows:

- Stored Procedures

  Stored procedures operate independently of transactions. A stored procedure can be started within a transaction, and a transaction can be started or ended from within a stored procedure. If called from within a transaction, a stored procedure can execute statements that force a commit of the parent transaction and then start a new transaction.

  If a stored procedure is started within a transaction, that transaction is the parent of the stored procedure event.

  If a transaction is started by a stored procedure, the stored procedure is the parent of the transaction event.

- Stored Functions

  Stored functions are restricted from causing an explicit or implicit commit or rollback. Stored function events can reside within a parent transaction event.

- Triggers

  Triggers activate as part of a statement that accesses the table with which it is associated, so the parent of a trigger event is always the statement that activates it.

  Triggers cannot issue statements that cause an explicit or implicit commit or rollback of a transaction.

- Scheduled Events

  The execution of the statements in the body of a scheduled event takes place in a new connection. Nesting of a scheduled event within a parent transaction is not applicable.

Transactions and Savepoints

Savepoint statements are recorded as separate statement events. Transaction events include separate counters for `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

Transactions and Errors

Errors and warnings that occur within a transaction are recorded in statement events, but not in the corresponding transaction event. This includes transaction-specific errors and warnings, such as a rollback on a nontransactional table or GTID consistency errors.

25.11.7.1 The events_transactions_current Table

The `events_transactions_current` table contains current transaction events, one row per thread showing the current status of the thread's most recent monitored transaction event. For example:

```
mysql> SELECT * FROM events_transactions_current LIMIT 1\G
*************************** 1. row ***************************
                    THREAD_ID: 26
                     EVENT_ID: 7
                 END_EVENT_ID: NULL
                   EVENT_NAME: transaction
                        STATE: ACTIVE
                       TRX_ID: NULL
                         GTID: 3E11FA47-71CA-11E1-9E33-C80AA9429562:56
                          XID: NULL
                     XA_STATE: NULL
                       SOURCE: transaction.cc:150
                  TIMER_START: 420833537900000
                    TIMER_END: NULL
                   TIMER_WAIT: NULL
                  ACCESS_MODE: READ WRITE
              ISOLATION_LEVEL: REPEATABLE READ
                   AUTOCOMMIT: NO
            NUMBER_OF_SAVEPOINTS: 0
NUMBER_OF_ROLLBACK_TO_SAVEPOINT: 0
    NUMBER_OF_RELEASE_SAVEPOINT: 0
          OBJECT_INSTANCE_BEGIN: NULL
               NESTING_EVENT_ID: 6
             NESTING_EVENT_TYPE: STATEMENT
```

Of the tables that contain transaction event rows, `events_transactions_current` is the most fundamental. Other tables that contain transaction event rows are logically derived from the current events. For example, the `events_transactions_history` and `events_transactions_history_long` tables are collections of the most recent transaction events, up to a fixed number of rows.

For information about configuration of transaction event collection, see Section 25.11.7, “Performance Schema Transaction Tables”.

The `events_transactions_current` table has these columns:

- `THREAD_ID`, `EVENT_ID`

  The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- `END_EVENT_ID`

  This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- `EVENT_NAME`

The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 25.6, “Performance Schema Instrument Naming Conventions”.

- `STATE`

  The current transaction state. The value is `ACTIVE` (after `START TRANSACTION` or `BEGIN`), `COMMITTED` (after `COMMIT`), or `ROLLED BACK` (after `ROLLBACK`).

- `TRX_ID`

  Unused.

- `GTID`

  The GTID column contains the value of `gtid_next`, which can be one of `ANONYMOUS`, `AUTOMATIC`, or a GTID using the format `UUID:NUMBER`. For transactions that use `gtid_next=AUTOMATIC`, which is all normal client transactions, the GTID column changes when the transaction commits and the actual GTID is assigned. If `gtid_mode` is either `ON` or `ON_PERMISSIVE`, the GTID column changes to the transaction's GTID. If `gtid_mode` is either `OFF` or `OFF_PERMISSIVE`, the GTID column changes to `ANONYMOUS`.

- `XID_FORMAT_ID`, `XID_GTRID`, and `XID_BQUAL`

  The components of the XA transaction identifier. They have the format described in Section 13.3.8.1, “XA Transaction SQL Syntax”.

- `XA_STATE`

  The state of the XA transaction. The value is `ACTIVE` (after `XA START`), `IDLE` (after `XA END`), `PREPARED` (after `XA PREPARE`), `ROLLED BACK` (after `XA ROLLBACK`), or `COMMITTED` (after `XA COMMIT`).

- `SOURCE`

  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `TIMER_START`, `TIMER_END`, `TIMER_WAIT`

  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

  If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END` − `TIMER_START`).

  If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

  For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 25.4.1, “Performance Schema Event Timing”.

- `ACCESS_MODE`

  The transaction access mode. The value is `READ ONLY` or `READ WRITE`.

- `ISOLATION_LEVEL`

  The transaction isolation level. The value is `REPEATABLE READ`, `READ COMMITTED`, `READ UNCOMMITTED`, or `SERIALIZABLE`.

- `AUTOCOMMIT`

  Whether autcommit mode was enabled when the transaction started.

- `NUMBER_OF_SAVEPOINTS`, `NUMBER_OF_ROLLBACK_TO_SAVEPOINT`, `NUMBER_OF_RELEASE_SAVEPOINT`

  The number of `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

- `OBJECT_INSTANCE_BEGIN`

  Unused.

- `NESTING_EVENT_ID`

  The `EVENT_ID` value of the event within which this event is nested.

- `NESTING_EVENT_TYPE`

  The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`. (`TRANSACTION` will not appear because transactions cannot be nested.)

The `events_transactions_current` table has these indexes:

- Primary key on (`THREAD_ID`, `EVENT_ID`)

`TRUNCATE TABLE` is permitted for the `events_transactions_current` table. It removes the rows.

25.11.7.2 The events_transactions_history Table

The `events_transactions_history` table contains the most recent *`N`* transaction events per thread. The value of *`N`* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_transactions_history_size` system variable at server startup. Transaction events are not added to the table until they have ended. As new events are added, older events are discarded if the table is full.

The `events_transactions_history` table has the same structure as `events_transactions_current`, including indexing. See Section 25.11.7.1, “The events_transactions_current Table”.

`TRUNCATE TABLE` is permitted for the `events_transactions_history` table. It removes the rows.

For information about configuration of transaction event collection, see Section 25.11.7, “Performance Schema Transaction Tables”.

25.11.7.3 The events_transactions_history_long Table

The `events_transactions_history_long` table contains the most recent *`N`* transaction events. The value of *`N`* is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_transactions_history_long_size` system variable at server startup. Transaction events are not added to the table until they have ended. As new events are added, older events are discarded if the table is full. When a thread ends, its rows are removed from the table.

The `events_transactions_history_long` table has the same structure as `events_transactions_current`, except that it has no indexes. See Section 25.11.7.1, “The events_transactions_current Table”.

`TRUNCATE TABLE` is permitted for the `events_transactions_history_long` table. It removes the rows.

For information about configuration of transaction event collection, see Section 25.11.7, “Performance Schema Transaction Tables”.

25.11.8 Performance Schema Connection Tables

When a client connects to the MySQL server, it does so under a particular user name and from a particular host. The Performance Schema provides statistics about these connections, tracking them per account (user and host combination) as well as separately per user name and host name, using these tables:

- `accounts`: Connection statistics per client account
- `hosts`: Connection statistics per client host name
- `users`: Connection statistics per client user name

The meaning of “account” in the connection tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Each connection table has `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns to track the current and total number of connections per “tracking value” on which its statistics are based. The tables differ in what they use for the tracking value. The `accounts` table has `USER` and `HOST` columns to track connections per user and host combination. The `users` and `hosts` tables have a `USER` and `HOST` column, respectively, to track connections per user name and host name.

The Performance Schema also counts internal threads and threads for user sessions that failed to authenticate, using rows with `USER` and `HOST` column values of `NULL`.

Suppose that clients named `user1` and `user2` each connect one time from `hosta` and `hostb`. The Performance Schema tracks the connections as follows:

- The `accounts` table has four rows, for the `user1`/`hosta`, `user1`/`hostb`, `user2`/`hosta`, and `user2`/`hostb` account values, each row counting one connection per account.
- The `hosts` table has two rows, for `hosta` and `hostb`, each row counting two connections per host name.
- The `users` table has two rows, for `user1` and `user2`, each row counting two connections per user name.

When a client connects, the Performance Schema determines which row in each connection table applies, using the tracking value appropriate to each table. If there is no such row, one is added. Then the Performance Schema increments by one the `CURRENT_CONNECTIONS` and `TOTAL_CONNECTIONS` columns in that row.

When a client disconnects, the Performance Schema decrements by one the `CURRENT_CONNECTIONS` column in the row and leaves the `TOTAL_CONNECTIONS` column unchanged.

`TRUNCATE TABLE` is permitted for connection tables. It has these effects:

- Rows are removed for accounts, hosts, or users that have no current connections (rows with `CURRENT_CONNECTIONS = 0`).
- Nonremoved rows are reset to count only current connections: For rows with `CURRENT_CONNECTIONS > 0`, `TOTAL_CONNECTIONS` is reset to `CURRENT_CONNECTIONS`.
- Summary tables that depend on the connection table are implicitly truncated, as described later in this section.

The Performance Schema maintains summary tables that aggregate connection statistics for various event types by account, host, or user. These tables have `_summary_by_account`, `_summary_by_host`, or `_summary_by_user` in the name. To identify them, use this query:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
       WHERE TABLE_SCHEMA = 'performance_schema'
       AND TABLE_NAME REGEXP '_summary_by_(account|host|user)'
       ORDER BY TABLE_NAME;
+-----------------------------------------------------+
| TABLE_NAME                                          |
+-----------------------------------------------------+
| events_errors_summary_by_account_by_error           |
| events_errors_summary_by_host_by_error              |
| events_errors_summary_by_user_by_error              |
| events_stages_summary_by_account_by_event_name      |
| events_stages_summary_by_host_by_event_name         |
| events_stages_summary_by_user_by_event_name         |
| events_statements_summary_by_account_by_event_name  |
| events_statements_summary_by_host_by_event_name     |
| events_statements_summary_by_user_by_event_name     |
| events_transactions_summary_by_account_by_event_name |
| events_transactions_summary_by_host_by_event_name   |
| events_transactions_summary_by_user_by_event_name   |
| events_waits_summary_by_account_by_event_name       |
| events_waits_summary_by_host_by_event_name          |
| events_waits_summary_by_user_by_event_name          |
| memory_summary_by_account_by_event_name             |
| memory_summary_by_host_by_event_name                |
| memory_summary_by_user_by_event_name                |
+-----------------------------------------------------+
```

For details about individual connection summary tables, consult the section that describes tables for the summarized event type:

- Wait event summaries: Section 25.11.15.1, “Wait Event Summary Tables”
- Stage event summaries: Section 25.11.15.2, “Stage Summary Tables”
- Statement event summaries: Section 25.11.15.3, “Statement Summary Tables”
- Transaction event summaries: Section 25.11.15.5, “Transaction Summary Tables”
- Memory event summaries: Section 25.11.15.10, “Memory Summary Tables”
- Error event summaries: Section 25.11.15.11, “Error Summary Tables”

`TRUNCATE TABLE` is permitted for connection summary tables. It removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows. In addition, each summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends. The following table describes the relationship between connection table truncation and implicitly truncated tables.

Table 25.2 Implicit Effects of Connection Table Truncation

Truncated Connection Table	Implicitly Truncated Summary Tables
`accounts`	Tables with names containing `_summary_by_account`, `_summary_by_thread`
`hosts`	Tables with names containing `_summary_by_account`, `_summary_by_host`, `_summary_by_thread`
`users`	Tables with names containing `_summary_by_account`, `_summary_by_user`, `_summary_by_thread`

Truncating a `_summary_global` summary table also implicitly truncates its corresponding connection and thread summary tables. For example, truncating `events_waits_summary_global_by_event_name` implicitly truncates the wait event summary tables that are aggregated by account, host, user, or thread.

25.11.8.1 The accounts Table

The `accounts` table contains a row for each account that has connected to the MySQL server. For each account, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_accounts_size` system variable at server startup. To disable account statistics, set this variable to 0.

The `accounts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see Section 25.11.8, "Performance Schema Connection Tables".

- `USER`

  The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `HOST`

  The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

  The current number of connections for the account.

- `TOTAL_CONNECTIONS`

  The total number of connections for the account.

The `accounts` table has these indexes:

- Primary key on (`USER`, `HOST`)

25.11.8.2 The hosts Table

The `hosts` table contains a row for each host from which clients have connected to the MySQL server. For each host name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_hosts_size` system variable at server startup. To disable host statistics, set this variable to 0.

The `hosts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see Section 25.11.8, "Performance Schema Connection Tables".

- `HOST`

  The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

  The current number of connections for the host.

- `TOTAL_CONNECTIONS`

  The total number of connections for the host.

The `hosts` table has these indexes:

- Primary key on (`HOST`)

25.11.8.3 The users Table

The `users` table contains a row for each user who has connected to the MySQL server. For each user name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_users_size` system variable at server startup. To disable user statistics, set this variable to 0.

The `users` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see Section 25.11.8, "Performance Schema Connection Tables".

- `USER`

  The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- `CURRENT_CONNECTIONS`

  The current number of connections for the user.

- `TOTAL_CONNECTIONS`

  The total number of connections for the user.

The `users` table has these indexes:

- Primary key on (`USER`)

25.11.9 Performance Schema Connection Attribute Tables

Application programs can provide key/value pairs as connection attributes to be passed to the server at connect time. For the C API, define the attribute set using the `mysql_options()` and `mysql_options4()` functions. Other MySQL Connectors may provide their own attribute-definition methods.

These tables expose attribute information:

- `session_account_connect_attrs`: Connection attributes for the current session, and other sessions associated with the session account
- `session_connect_attrs`: Connection attributes for all sessions

Attribute names that begin with an underscore (_) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes.

The set of connection attributes visible on a given connection varies depending on your platform and MySQL Connector used to establish the connection.

The `libmysqlclient` client library (provided in MySQL and MySQL Connector/C distributions) sets these attributes:

- `_client_name`: The client name (`libmysql` for the client library)
- `_client_version`: The client library version
- `_os`: The operating system (for example, `Linux`, `Win64`)
- `_pid`: The client process ID
- `_platform`: The machine platform (for example, `x86_64`)
- `_thread`: The client thread ID (Windows only)

Other MySQL Connectors may define their own connection attributes.

MySQL Connector/J defines these attributes:

- `_client_license`: The connector license type
- `_runtime_vendor`: The Java runtime environment (JRE) vendor
- `_runtime_version`: The Java runtime environment (JRE) version

MySQL Connector/Net defines these attributes:

- `_client_version`: The client library version
- `_os`: The operating system (for example, `Linux`, `Win64`)
- `_pid`: The client process ID
- `_platform`: The machine platform (for example, `x86_64`)
- `_program_name`: The client name
- `_thread`: The client thread ID (Windows only)

PHP defines attributes that depend on how it was compiled:

- Compiled using `libmysqlclient`: The standard `libmysqlclient` attributes, described previously
- Compiled using `mysqlnd`: Only the `_client_name` attribute, with a value of `mysqlnd`

Many MySQL client programs set a `program_name` attribute with a value equal to the client name. For example, `mysqladmin` and `mysqldump` set `program_name` to `mysqladmin` and `mysqldump`, respectively.

Some MySQL client programs define additional attributes:

- `mysqlbinlog` defines the `_client_role` attribute as `binary_log_listener`.
- Replication slave connections define `program_name` as `mysqld`, `_client_role` as `binary_log_listener`, and `_client_replication_channel_name` as the channel name.
- `FEDERATED` storage engine connections define `program_name` as `mysqld` and `_client_role` as `federated_storage`.

There are limits on the amount of connection attribute data transmitted from client to server: A fixed limit imposed by the client prior to connect time; a fixed limit imposed by the server at connect time; and a configurable limit imposed by the Performance Schema at connect time.

For connections initiated using the C API, the `libmysqlclient` library imposes a limit of 64KB on the aggregate size of connection attribute data on the client side: Calls to `mysql_options()` that cause this limit to be exceeded produce a `CR_INVALID_PARAMETER_NO` error. Other MySQL Connectors may impose their own client-side limits on how much connection attribute data can be transmitted to the server.

On the server side, these size checks on connection attribute data occur:

- The server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable.
- For accepted connections, the Performance Schema checks aggregate attribute size against the value of the `performance_schema_session_connect_attrs_size` system variable. If attribute size exceeds this value, these actions take place:

- The Performance Schema truncates the attribute data and increments the `Performance_schema_session_connect_attrs_lost` status variable, which indicates the number of connections for which attribute truncation occurred.
- The Performance Schema writes a message to the error log if the `log_error_verbosity` system variable is greater than 1:

```
Connection attributes of length N were truncated (N bytes lost)
for connection N, user user_name@host_name (as user_name), auth: {yes|no}
```

  The information in the warning message is intended to help DBAs identify clients for which attribute truncation occurred.
- A `_truncated` attribute is added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

25.11.9.1 The session_account_connect_attrs Table

Application programs can provide key/value connection attributes to be passed to the server at connect time, using the `mysql_options()` and `mysql_options4()` C API functions. For descriptions of common attributes, see Section 25.11.9, “Performance Schema Connection Attribute Tables”.

The `session_account_connect_attrs` table contains connection attributes only for sessions for your own account. To see connection attributes for all sessions, look in the `session_connect_attrs` table.

The `session_account_connect_attrs` table contains these columns:

- `PROCESSLIST_ID`

  The connection identifier for the session.
- `ATTR_NAME`

  The attribute name.
- `ATTR_VALUE`

  The attribute value.
- `ORDINAL_POSITION`

  The order in which the attribute was added to the set of connection attributes.

The `session_account_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_account_connect_attrs` table.

25.11.9.2 The session_connect_attrs Table

Application programs can provide key/value connection attributes to be passed to the server at connect time, using the `mysql_options()` and `mysql_options4()` C API functions. For descriptions of common attributes, see Section 25.11.9, “Performance Schema Connection Attribute Tables”.

The `session_connect_attrs` table contains connection attributes for all sessions. To see connection attributes only for sessions for your own account, look in the `session_account_connect_attrs` table.

The `session_connect_attrs` table contains these columns:

- `PROCESSLIST_ID`

  The connection identifier for the session.

- `ATTR_NAME`

  The attribute name.

- `ATTR_VALUE`

  The attribute value.

- `ORDINAL_POSITION`

  The order in which the attribute was added to the set of connection attributes.

The `session_connect_attrs` table has these indexes:

- Primary key on (`PROCESSLIST_ID`, `ATTR_NAME`)

`TRUNCATE TABLE` is not permitted for the `session_connect_attrs` table.

25.11.10 Performance Schema User Variable Tables

The Performance Schema provides a `user_variables_by_thread` table that exposes user-defined variables. These are variables defined within a specific session and include a `@` character preceding the name; see Section 9.4, “User-Defined Variables”.

The `user_variables_by_thread` table contains these columns:

- `THREAD_ID`

  The thread identifier of the session in which the variable is defined.

- `VARIABLE_NAME`

  The variable name, without the leading `@` character.

- `VARIABLE_VALUE`

  The variable value.

The `user_variables_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_variables_by_thread` table.

25.11.11 Performance Schema Replication Tables

The Performance Schema provides tables that expose replication information. This is similar to the information available from the `SHOW SLAVE STATUS` statement, but representation in table form is more accessible and has usability benefits:

- `SHOW SLAVE STATUS` output is useful for visual inspection, but not so much for programmatic use. By contrast, using the Performance Schema tables, information about slave status can be searched using general `SELECT` queries, including complex `WHERE` conditions, joins, and so forth.

- Query results can be saved in tables for further analysis, or assigned to variables and thus used in stored procedures.

- The replication tables provide better diagnostic information. For multi-threaded slave operation, `SHOW SLAVE STATUS` reports all coordinator and worker thread errors using the `Last_SQL_Errno` and `Last_SQL_Error` fields, so only the most recent of those errors is visible and information can be lost. The replication tables store errors on a per-thread basis without loss of information.
- The last seen transaction is visible in the replication tables on a per-worker basis. This is information not avilable from `SHOW SLAVE STATUS`.
- Developers familiar with the Performance Schema interface can extend the replication tables to provide additional information by adding rows to the tables.

Replication Table Descriptions

The Performance Schema provides the following replication-related tables:

- Tables that contain information about the connection of the slave server to the master server:
  - `replication_connection_configuration`: Configuration parameters for connecting to the master
  - `replication_connection_status`: Current status of the connection to the master
- Tables that contain general (not thread-specific) information about the transaction applier:
  - `replication_applier_configuration`: Configuration parameters for the transaction applier on the slave.
  - `replication_applier_status`: Current status of the transaction applier on the slave.
- Tables that contain information about specific threads responsible for applying transactions received from the master:
  - `replication_applier_status_by_coordinator`: Status of the coordinator thread (empty unless the slave is multi-threaded).
  - `replication_applier_status_by_worker`: Status of the applier thread or worker threads if the slave is multi-threaded.
- Tables that contain information about channel based replication filters:
  - `replication_applier_filters`: Provides information about the replication filters configured on specific replication channels.
  - `replication_applier_global_filters`: Provides information about global replication filters, which apply to all replication channels.
- Tables that contain information about Group Replication members:
  - `replication_group_members`: Provides network and status information for group members.
  - `replication_group_member_stats`: Provides statistical information about group members and transactions in which they participate.

  For more information see Section 21.3, “Monitoring Group Replication”.

The following Performance Schema replication tables continue to be populated when the Performance Schema is disabled:

- `replication_connection_configuration`
- `replication_connection_status`
- `replication_applier_configuration`

- `replication_applier_status`
- `replication_applier_status_by_coordinator`
- `replication_applier_status_by_worker`

The exception is local timing information (start and end timestamps for transactions) in the replication tables `replication_connection_status`, `replication_applier_status_by_coordinator`, and `replication_applier_status_by_worker`. This information is not collected when the Performance Schema is disabled.

The following sections describe each replication table in more detail, including the correspondence between the columns produced by `SHOW SLAVE STATUS` and the replication table columns in which the same information appears.

The remainder of this introduction to the replication tables describes how the Performance Schema populates them and which fields from `SHOW SLAVE STATUS` are not represented in the tables.

Replication Table Life Cycle

The Performance Schema populates the replication tables as follows:

- Prior to execution of `CHANGE MASTER TO`, the tables are empty.
- After `CHANGE MASTER TO`, the configuration parameters can be seen in the tables. At this time, there are no active slave threads, so the `THREAD_ID` columns are `NULL` and the `SERVICE_STATE` columns have a value of `OFF`.
- After `START SLAVE`, non-`NULL` `THREAD_ID` values can be seen. Threads that are idle or active have a `SERVICE_STATE` value of `ON`. The thread that connects to the master server has a value of `CONNECTING` while it establishes the connection, and `ON` thereafter as long as the connection lasts.
- After `STOP SLAVE`, the `THREAD_ID` columns become `NULL` and the `SERVICE_STATE` columns for threads that no longer exist have a value of `OFF`.
- The tables are preserved after `STOP SLAVE` or threads dying due to an error.
- The `replication_applier_status_by_worker` table is nonempty only when the slave is operating in multi-threaded mode. That is, if the `slave_parallel_workers` system variable is greater than 0, this table is populated when `START SLAVE` is executed, and the number of rows shows the number of workers.

SHOW SLAVE STATUS Information Not In the Replication Tables

The information in the Performance Schema replication tables differs somewhat from the information available from `SHOW SLAVE STATUS` because the tables are oriented toward use of global transaction identifiers (GTIDs), not file names and positions, and they represent server UUID values, not server ID values. Due to these differences, several `SHOW SLAVE STATUS` columns are not preserved in the Performance Schema replication tables, or are represented a different way:

- The following fields refer to file names and positions and are not preserved:

```
Master_Log_File
Read_Master_Log_Pos
Relay_Log_File
Relay_Log_Pos
Relay_Master_Log_File
Exec_Master_Log_Pos
Until_Condition
Until_Log_File
Until_Log_Pos
```

- The `Master_Info_File` field is not preserved. It refers to the `master.info` file, which has been superseded by crash-safe slave tables.
- The following fields are based on `server_id`, not `server_uuid`, and are not preserved:

```
Master_Server_Id
Replicate_Ignore_Server_Ids
```

- The `Skip_Counter` field is based on event counts, not GTIDs, and is not preserved.
- These error fields are aliases for `Last_SQL_Errno` and `Last_SQL_Error`, so they are not preserved:

```
Last_Errno
Last_Error
```

  In the Performance Schema, this error information is available in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns of the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the slave is multi-threaded). Those tables provide more specific per-thread error information than is available from `Last_Errno` and `Last_Error`.

- Fields that provide information about command-line filtering options is not preserved:

```
Replicate_Do_DB
Replicate_Ignore_DB
Replicate_Do_Table
Replicate_Ignore_Table
Replicate_Wild_Do_Table
Replicate_Wild_Ignore_Table
```

- The `Slave_IO_State` and `Slave_SQL_Running_State` fields are not preserved. If needed, these values can be obtained from the process list by using the `THREAD_ID` column of the appropriate replication table and joining it with the `ID` column in the `INFORMATION_SCHEMA PROCESSLIST` table to select the `STATE` column of the latter table.
- The `Executed_Gtid_Set` field can show a large set with a great deal of text. Instead, the Performance Schema tables show GTIDs of transactions that are currently being applied by the slave. Alternatively, the set of executed GTIDs can be obtained from the value of the `gtid_executed` system variable.
- The `Seconds_Behind_Master` and `Relay_Log_Space` fields are in to-be-decided status and are not preserved.

Status Variables Moved to Replication Tables

As of MySQL version 5.7.5, the following status variables (previously monitored using `SHOW STATUS`) were moved to the Perfomance Schema replication tables:

- `Slave_retried_transactions`
- `Slave_last_heartbeat`
- `Slave_received_heartbeats`
- `Slave_heartbeat_period`
- `Slave_running`

These status variables are now only relevant when a single replication channel is being used because they *only* report the status of the default replication channel. When multiple replication channels exist,

use the Performance Schema replication tables described in this section, which report these variables for each existing replication channel.

Replication Channels

The first column of the replication Performance Schema tables is `CHANNEL_NAME`. This enables the tables to be viewed per replication channel. In a non-multisource replication setup there is a single default replication channel. When you are using multiple replication channels on a slave, you can filter the tables per replication channel to monitor a specific replication channel. See Section 18.2.3, "Replication Channels" and Section 18.1.4.3, "Multi-Source Replication Monitoring" for more information.

25.11.11.1 The replication_connection_configuration Table

This table shows the configuration parameters used by the slave server for connecting to the master server. Parameters stored in the table can be changed at runtime with the `CHANGE MASTER TO` statement, as indicated in the column descriptions.

Compared to the `replication_connection_status` table, `replication_connection_configuration` changes less frequently. It contains values that define how the slave connects to the master and that remain constant during the connection, whereas `replication_connection_status` contains values that change during the connection.

The `replication_connection_configuration` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, "Replication Channels" for more information.

- `HOST`

  The master host that the slave is connected to. (`CHANGE MASTER TO` option: `MASTER_HOST`)

- `PORT`

  The port used to connect to the master. (`CHANGE MASTER TO` option: `MASTER_PORT`)

- `USER`

  The user name of the account used to connect to the master. (`CHANGE MASTER TO` option: `MASTER_USER`)

- `NETWORK_INTERFACE`

  The network interface that the slave is bound to, if any. (`CHANGE MASTER TO` option: `MASTER_BIND`)

- `AUTO_POSITION`

  1 if autopositioning is in use; otherwise 0. (`CHANGE MASTER TO` option: `MASTER_AUTO_POSITION`)

- `SSL_ALLOWED`, `SSL_CA_FILE`, `SSL_CA_PATH`, `SSL_CERTIFICATE`, `SSL_CIPHER`, `SSL_KEY`, `SSL_VERIFY_SERVER_CERTIFICATE`, `SSL_CRL_FILE`, `SSL_CRL_PATH`

  These columns show the SSL parameters used by the slave to connect to the master, if any.

  `SSL_ALLOWED` has these values:

  - `Yes` if an SSL connection to the master is permitted
  - `No` if an SSL connection to the master is not permitted

  - `Ignored` if an SSL connection is permitted but the slave server does not have SSL support enabled

  `CHANGE MASTER TO` options for the other SSL columns: `MASTER_SSL_CA`, `MASTER_SSL_CAPATH`, `MASTER_SSL_CERT`, `MASTER_SSL_CIPHER`, `MASTER_SSL_CRL`, `MASTER_SSL_CRLPATH`, `MASTER_SSL_KEY`, `MASTER_SSL_VERIFY_SERVER_CERT`.

- `CONNECTION_RETRY_INTERVAL`

  The number of seconds between connect retries. (`CHANGE MASTER TO` option: `MASTER_CONNECT_RETRY`)

- `CONNECTION_RETRY_COUNT`

  The number of times the slave can attempt to reconnect to the master in the event of a lost connection. (`CHANGE MASTER TO` option: `MASTER_RETRY_COUNT`)

- `HEARTBEAT_INTERVAL`

  The replication heartbeat interval on a slave, measured in seconds.

The `replication_connection_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_connection_configuration` table.

The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

`replication_connection_configuration` Column	**`SHOW SLAVE STATUS` Column**
`HOST`	`Master_Host`
`PORT`	`Master_Port`
`USER`	`Master_User`
`NETWORK_INTERFACE`	`Master_Bind`
`AUTO_POSITION`	`Auto_Position`
`SSL_ALLOWED`	`Master_SSL_Allowed`
`SSL_CA_FILE`	`Master_SSL_CA_File`
`SSL_CA_PATH`	`Master_SSL_CA_Path`
`SSL_CERTIFICATE`	`Master_SSL_Cert`
`SSL_CIPHER`	`Master_SSL_Cipher`
`SSL_KEY`	`Master_SSL_Key`
`SSL_VERIFY_SERVER_CERTIFICATE`	`Master_SSL_Verify_Server_Cert`
`SSL_CRL_FILE`	`Master_SSL_Crl`
`SSL_CRL_PATH`	`Master_SSL_Crlpath`
`CONNECTION_RETRY_INTERVAL`	`Connect_Retry`
`CONNECTION_RETRY_COUNT`	`Master_Retry_Count`

25.11.11.2 The replication_connection_status Table

This table shows the current status of the I/O thread that handles the slave server connection to the master server, information on the last transaction queued in the relay log, and information on the transaction currently being queued in the relay log.

Compared to the `replication_connection_configuration` table, `replication_connection_status` changes more frequently. It contains values that change during the connection, whereas `replication_connection_configuration` contains values which define how the slave connects to the master and that remain constant during the connection.

The `replication_connection_status` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, “Replication Channels” for more information.

- `GROUP_NAME`

  If this server is a member of a group, shows the name of the group the server belongs to.

- `SOURCE_UUID`

  The `server_uuid` value from the master.

- `THREAD_ID`

  The I/O thread ID.

- `SERVICE_STATE`

  `ON` (thread exists and is active or idle), `OFF` (thread no longer exists), or `CONNECTING` (thread exists and is connecting to the master).

- `RECEIVED_TRANSACTION_SET`

  The set of global transaction IDs (GTIDs) corresponding to all transactions received by this slave. Empty if GTIDs are not in use. See GTID Sets for more information.

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

  The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave's error log.

  Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the most recent I/O error took place.

- `LAST_HEARTBEAT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the most recent heartbeat signal was received by a replication slave.

- `COUNT_RECEIVED_HEARTBEATS`

  The total number of heartbeat signals that a replication slave received since the last time it was restarted or reset, or a `CHANGE MASTER TO` statement was issued.

- `LAST_QUEUED_TRANSACTION`

  The global transaction ID (GTID) of the last transaction that was queued to the relay log.

- `LAST_QUEUED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction queued in the relay log was committed on the original master.

- `LAST_QUEUED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction queued in the relay log was committed on the immediate master.

- `LAST_QUEUED_TRANSACTION_START_QUEUE_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction was placed in the relay log queue by this I/O thread.

- `LAST_QUEUED_TRANSACTION_END_QUEUE_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction was queued to the relay log files.

- `QUEUEING_TRANSACTION`

  The global transaction ID (GTID) of the currently queueing transaction in the relay log.

- `QUEUEING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the currently queueing transaction was committed on the original master.

- `QUEUEING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the currently queueing transaction was committed on the immediate master.

- `QUEUEING_TRANSACTION_START_QUEUE_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the first event of the currently queueing transaction was written to the relay log by this I/O thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for queued transactions are zero.

The `replication_connection_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_connection_status` columns and `SHOW SLAVE STATUS` columns.

`replication_connection_status` Column	**`SHOW SLAVE STATUS` Column**
`SOURCE_UUID`	`Master_UUID`
`THREAD_ID`	None
`SERVICE_STATE`	`Slave_IO_Running`
`RECEIVED_TRANSACTION_SET`	`Retrieved_Gtid_Set`
`LAST_ERROR_NUMBER`	`Last_IO_Errno`
`LAST_ERROR_MESSAGE`	`Last_IO_Error`
`LAST_ERROR_TIMESTAMP`	`Last_IO_Error_Timestamp`

25.11.11.3 The replication_applier_configuration Table

This table shows the configuration parameters that affect transactions applied by the slave server. Parameters stored in the table can be changed at runtime with the `CHANGE MASTER TO` statement, as indicated in the column descriptions.

The `replication_applier_configuration` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, “Replication Channels” for more information.

- `DESIRED_DELAY`

  The number of seconds that the slave must lag the master. (`CHANGE MASTER TO` option: `MASTER_DELAY`) See Section 18.3.11, “Delayed Replication” for more information.

The `replication_applier_configuration` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_configuration` table.

The following table shows the correspondence between `replication_applier_configuration` columns and `SHOW SLAVE STATUS` columns.

`replication_applier_configuration` Column	**`SHOW SLAVE STATUS` Column**
`DESIRED_DELAY`	`SQL_Delay`

25.11.11.4 The replication_applier_status Table

This table shows the current general transaction execution status on the slave server. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the slave is multi-threaded).

The `replication_applier_status` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, “Replication Channels” for more information.

- `SERVICE_STATE`

  Shows `ON` when the replication channel's applier threads are active or idle, `OFF` means that the applier threads are not active.

- `REMAINING_DELAY`

  If the slave is waiting for `DESIRED_DELAY` seconds to pass since the master applied an transaction, this field contains the number of delay seconds remaining. At other times, this field is `NULL`. (The `DESIRED_DELAY` value is stored in the `replication_applier_configuration` table.) See Section 18.3.11, “Delayed Replication” for more information.

- `COUNT_TRANSACTIONS_RETRIES`

  Shows the number of retries that were made because the slave SQL thread failed to apply a transaction.

The `replication_applier_status` table has these indexes:

- Primary key on (`CHANNEL_NAME`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_status` table.

The following table shows the correspondence between `replication_applier_status` columns and `SHOW SLAVE STATUS` columns.

`replication_applier_status` Column	**`SHOW SLAVE STATUS` Column**
`SERVICE_STATE`	None
`REMAINING_DELAY`	`SQL_Remaining_Delay`

25.11.11.5 The replication_applier_status_by_coordinator Table

For a multi-threaded slave, the slave uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded slave, this table is empty. For a multi-threaded slave, the `replication_applier_status_by_worker` table shows the status of the worker threads. This table provides information about the last transaction which was buffered by the coordinator thread to a worker's queue, as well as the transaction it is currently buffering. The start timestamp refers to when this thread read the first event of the transaction from the relay log to buffer it to a worker's queue, while the end timestamp refers to when the last event finished buffering to the worker's queue.

The `replication_applier_status_by_coordinator` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, "Replication Channels" for more information.

- `THREAD_ID`

  The SQL/coordinator thread ID.

- `SERVICE_STATE`

  `ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

  The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means "no error". If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave's error log.

  Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

  All error codes and messages displayed in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns correspond to error values listed in Section B.3, "Server Error Codes and Messages".

- `LAST_ERROR_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the most recent SQL/coordinator error occurred.

- `LAST_PROCESSED_TRANSACTION`

  The global transaction ID (GTID) of the last transaction processed by this coordinator.

- `LAST_PROCESSED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction processed by this coordinator was committed on the original master.

- `LAST_PROCESSED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction processed by this coordinator was committed on the immediate master.

- `LAST_PROCESSED_TRANSACTION_START_BUFFER_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when this coordinator thread started writing the last transaction to the buffer of a worker thread.

- `LAST_PROCESSED_TRANSACTION_END_BUFFER_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction was written to the buffer of a worker thread by this coordinator thread.

- `PROCESSING_TRANSACTION`

  The global transaction ID (GTID) of the transaction that this coordinator thread is currently processing.

- `PROCESSING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the currently processing transaction was committed on the original master.

- `PROCESSING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the currently processing transaction was committed on the immediate master.

- `PROCESSING_TRANSACTION_START_BUFFER_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when this coordinator thread started writing the currently processing transaction to the buffer of a worker thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for buffered transactions are zero.

The `replication_applier_status_by_coordinator` table has these indexes:

- Primary key on (`CHANNEL_NAME`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and `SHOW SLAVE STATUS` columns.

`replication_applier_status_by_coordinator` Column	**`SHOW SLAVE STATUS` Column**
`THREAD_ID`	None
`SERVICE_STATE`	`Slave_SQL_Running`
`LAST_ERROR_NUMBER`	`Last_SQL_Errno`
`LAST_ERROR_MESSAGE`	`Last_SQL_Error`
`LAST_ERROR_TIMESTAMP`	`Last_SQL_Error_Timestamp`

25.11.11.6 The replication_applier_status_by_worker Table

If the slave is not multi-threaded, this table shows the status of the applier thread. Otherwise, the slave uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the worker threads. For a multi-threaded slave, the `replication_applier_status_by_coordinator` table shows the status of the coordinator thread. This table provides details about the transactions applied, where the start timestamp refers to when the worker started applying the first event, and the end timestamp refers to when the last event of the transaction was applied.

The `replication_applier_status_by_worker` table has these columns:

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 18.2.3, “Replication Channels” for more information.

- `WORKER_ID`

  The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP SLAVE`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- `THREAD_ID`

  The worker thread ID.

- `SERVICE_STATE`

  `ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

  The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave's error log.

  Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

  All error codes and messages displayed in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns correspond to error values listed in Section B.3, “Server Error Codes and Messages”.

- `LAST_ERROR_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the most recent worker error occurred.

- `LAST_APPLIED_TRANSACTION`

  The global transaction ID (GTID) of the last transaction applied by this worker.

- `LAST_APPLIED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction applied by this worker was committed on the original master.

- `LAST_APPLIED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the last transaction applied by this worker was committed on the immediate master.

- `LAST_APPLIED_TRANSACTION_START_APPLY_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when this worker started applying the last applied transaction.

- `LAST_APPLIED_TRANSACTION_END_APPLY_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when this worker finished applying the last applied transaction.

- `APPLYING_TRANSACTION`

  The global transaction ID (GTID) of the transaction this worker is currently applying.

- `APPLYING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the transaction this worker is currently applying was committed on the original master.

- `APPLYING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when the transaction this worker is currently applying was committed on the immediate master.

- `APPLYING_TRANSACTION_START_APPLY_TIMESTAMP`

  A timestamp in `'YYYY-MM-DD HH:MM:SS[.fraction]'` format that shows when this worker started applying the transaction that is currently being applied.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for applied transactions are zero.

The `replication_applier_status_by_worker` table has these indexes:

- Primary key on (`CHANNEL_NAME`, `WORKER_ID`)
- Index on (`THREAD_ID`)

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW SLAVE STATUS` columns.

`replication_applier_status_by_worker` Column	`SHOW SLAVE STATUS` Column
`WORKER_ID`	None
`THREAD_ID`	None
`SERVICE_STATE`	None
`LAST_SEEN_TRANSACTION`	None
`LAST_ERROR_NUMBER`	`Last_SQL_Errno`
`LAST_ERROR_MESSAGE`	`Last_SQL_Error`
`LAST_ERROR_TIMESTAMP`	`Last_SQL_Error_Timestamp`

25.11.11.7 The replication_applier_global_filters Table

This table shows the global replication filters configured on this slave. The `replication_applier_global_filters` table has the following columns:

- `FILTER_NAME`

  The type of replication filter that has been configured.

- `FILTER_RULE`

  The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

  The method used to configure the replication filter, can be one of:

  - `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
  - `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.

- `ACTIVE_SINCE`

  Timestamp of when the replication filter was configured.

25.11.11.8 The replication_applier_filters Table

This table shows the replication channel specific filters configured on this slave. Each row provides information on a replication channel's configured type of filter. The `replication_applier_filters` table has the following columns:

- `CHANNEL_NAME`

  The name of replication channel with a replication filter configured.

- `FILTER_NAME`

  The type of replication filter that has been configured for this replication channel.

- `FILTER_RULE`

  The rules configured for the replication filter type using either `--replicate-*` command options or `CHANGE REPLICATION FILTER`.

- `CONFIGURED_BY`

  The method used to configure the replication filter, can be one of:

  - `CHANGE_REPLICATION_FILTER` configured by a global replication filter using a `CHANGE REPLICATION FILTER` statement.
  - `STARTUP_OPTIONS` configured by a global replication filter using a `--replicate-*` option.
  - `CHANGE_REPLICATION_FILTER_FOR_CHANNEL` configured by a channel specific replication filter using a `CHANGE REPLICATION FILTER FOR CHANNEL` statement.
  - `STARTUP_OPTIONS_FOR_CHANNEL` configured by a channel specific replication filter using a `--replicate-*` option.

- `ACTIVE_SINCE`

  Timestamp of when the replication filter was configured.

25.11.11.9 The replication_group_members Table

This table shows network and status information for replication group members.

The `replication_group_members` table has the following columns:

- `CHANNEL_NAME`

  Name of the group replication channel.

- `MEMBER_ID`

Identifier for this member; same as the server UUID.

- `MEMBER_HOST`

  Network address of this member (host name or IP address).

- `MEMBER_PORT`

  Port on which the server is listening.

- `MEMBER_STATE`

  Current state of this member; can be any one of the following:

  - `OFFLINE`: The group replication plugin is installed but has not been started.
  - `RECOVERING`: The server has joined a group from which it is retrieving data.
  - `ONLINE`: The member is in a fully functioning state.

- `MEMBER_ROLE`

  Role of the member in the group, either `PRIMARY` or `SECONDARY`.

- `MEMBER_VERSION`

  MySQL version of the member.

The `replication_group_members` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `replication_group_members` table.

25.11.11.10 The replication_group_member_stats Table

This table shows statistical information for replication group members.

The `replication_group_member_stats` table has the following columns:

- `CHANNEL_NAME`

  Name of the group replication channel

- `VIEW_ID`

  Current view identifier for this group.

- `MEMBER_ID`

  Identifier for this member; same as the server UUID.

- `COUNT_TRANSACTIONS_IN_QUEUE`

  Number of transactions pending certification

- `COUNT_TRANSACTIONS_CHECKED`

  Number of transactions already certified by this member.

- `COUNT_CONFLICTS_DETECTED`

  Number of transactions that were negatively certified.

- `COUNT_TRANSACTIONS_VALIDATING`

  Number of transactions with which one can execute certification with them, but have not been garbage collected.

- `TRANSACTIONS_COMMITTED_ALL_MEMBERS`

  Set of stable group transactions.

- `LAST_CONFLICT_FREE_TRANSACTION`

  Latest transaction certified without conflicts.

- `COUNT_TRANSACTIONS_REMOTE_IN_APPLIER_QUEUE`

  Number of waiting transactions this member has received from the group.

- `COUNT_TRANSACTIONS_REMOTE_APPLIED`

  Number of transactions this member has received from the group and applied.

- `COUNT_TRANSACTIONS_LOCAL_PROPOSED`

  Number of transactions this member originated and sent to the group.

- `COUNT_TRANSACTIONS_LOCAL_ROLLBACK`

  Number of transactions this member originated that were rolled back by the group.

The `replication_group_member_stats` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

25.11.12 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- `data_locks`: Data locks held and requested
- `data_lock_waits`: Relationships between data lock owners and data lock requestors blocked by those owners
- `metadata_locks`: Metadata locks held and requested
- `table_handles`: Table locks held and requested

The following sections describe these tables in more detail.

25.11.12.1 The data_locks Table

The `data_locks` table shows data locks held and requested. For information about which lock requests are blocked by which held locks, see Section 25.11.12.2, “The data_lock_waits Table”.

Example data lock information:

```
mysql> SELECT * FROM data_locks\G
*************************** 1. row ***************************
               ENGINE: INNODB
       ENGINE_LOCK_ID: 4140:74
ENGINE_TRANSACTION_ID: 4140
            THREAD_ID: 37
             EVENT_ID: 9
```

```
        OBJECT_SCHEMA: test
          OBJECT_NAME: t1
       PARTITION_NAME: NULL
    SUBPARTITION_NAME: NULL
           INDEX_NAME: NULL
OBJECT_INSTANCE_BEGIN: 140489308280888
            LOCK_TYPE: TABLE
            LOCK_MODE: IX
          LOCK_STATUS: GRANTED
            LOCK_DATA: NULL
*************************** 2. row ***************************
               ENGINE: INNODB
       ENGINE_LOCK_ID: 4140:66:5:1
ENGINE_TRANSACTION_ID: 4140
            THREAD_ID: 37
             EVENT_ID: 9
        OBJECT_SCHEMA: test
          OBJECT_NAME: t1
       PARTITION_NAME: NULL
    SUBPARTITION_NAME: NULL
           INDEX_NAME: GEN_CLUST_INDEX
OBJECT_INSTANCE_BEGIN: 140489320307736
            LOCK_TYPE: RECORD
            LOCK_MODE: X
          LOCK_STATUS: GRANTED
            LOCK_DATA: supremum pseudo-record
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_locks` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at Section 15.14.2, “InnoDB INFORMATION_SCHEMA Transaction and Locking Information”.

The `data_locks` table has these columns:

- `ENGINE`:

  The storage engine that holds or requested the lock.

- `ENGINE_LOCK_ID`:

  The ID of the lock held or requested by the storage engine. Tuples of (`ENGINE_LOCK_ID`, `ENGINE`) values are unique.

  Lock ID formats are internal and subject to change at any time. Applications should not rely on lock IDs having a particular format.

- `ENGINE_TRANSACTION_ID`:

  The storage engine internal ID of the transaction that requested the lock.

  For `InnoDB`, to obtain details about the transaction, join this column with the `TRX_ID` column of the `INFORMATION_SCHEMA INNODB_TRX` table.

- `THREAD_ID`:

  The thread ID of the that owns the lock. To obtain details about the thread, join this column with the `THREAD_ID` column of the Performance Schema `threads` table.

- `EVENT_ID`:

  The Performance Schema event that caused the lock. Tuples of (`THREAD_ID`, `EVENT_ID`) values implicitly identify a parent event in other Performance Schema tables:

  - The parent wait event in `events_waits_xxx` tables
  - The parent stage event in `events_stages_xxx` tables
  - The parent statement event in `events_statements_xxx` tables
  - The parent transaction event in `events_transactions_xxx` tables

  To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table.

- `OBJECT_SCHEMA`:

  The schema that contains the locked table.

- `OBJECT_NAME`:

  The name of the locked table.

- `PARTITION_NAME`:

  The name of the locked partition, if any; `NULL` otherwise.

- `SUBPARTITION_NAME`:

  The name of the locked subpartition, if any; `NULL` otherwise.

- `INDEX_NAME`:

  The name of the locked index, if any; `NULL` otherwise.

  In practice, `InnoDB` always creates an index (`GEN_CLUST_INDEX`), so `INDEX_NAME` is non-`NULL` for `InnoDB` tables.

- `OBJECT_INSTANCE_BEGIN`:

  The address in memory of the lock.

- `LOCK_TYPE`:

  The type of lock.

  The value is storage engine dependent. For `InnoDB`, permitted values are `RECORD` for a row-level lock, `TABLE` for a table-level lock.

- `LOCK_MODE`:

  How the lock is requested.

  The value is storage engine dependent. For `InnoDB`, permitted values are `S[,GAP]`, `X[,GAP]`, `IS[,GAP]`, `IX[,GAP]`, `AUTO_INC`, and `UNKNOWN`. Lock modes other than `AUTO_INC` and `UNKNOWN` indicate gap locks, if present. For information about `S`, `X`, `IS`, `IX`, and gap locks, refer to Section 15.5.1, “InnoDB Locking”.

- `LOCK_STATUS`:

  The status of the lock request.

  The value is storage engine dependent. For `InnoDB`, permitted values are `GRANTED` (lock is held) and `PENDING` (lock is being waited for).

- `LOCK_DATA`:

The data associated with the lock, if any.

The value is storage engine dependent. For `InnoDB`, values are primary key values of the locked record if `LOCK_TYPE` is `RECORD`, otherwise `NULL`. This column contains the values of the primary key columns in the locked row, formatted as a valid SQL string (ready to be copied to SQL statements). If there is no primary key, `LOCK_DATA` is the unique `InnoDB` internal row ID number. If a gap lock is taken for key values or ranges above the largest value in the index, `LOCK_DATA` reports `supremum pseudo-record`. When the page containing the locked record is not in the buffer pool (in the case that it was paged out to disk while the lock was held), `InnoDB` does not fetch the page from disk, to avoid unnecessary disk operations. Instead, `LOCK_DATA` is set to `NULL`.

The `data_locks` table has these indexes:

- Primary key on (`ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`THREAD_ID`, `EVENT_ID`)
- Index on (`OBJECT_SCHEMA`, `OBJECT_NAME`, `PARTITION_NAME`, `SUBPARTITION_NAME`)

`TRUNCATE TABLE` is not permitted for the `data_locks` table.

25.11.12.2 The data_lock_waits Table

The `data_lock_waits` table implements a many-to-many relationship showing which data lock requests in the `data_locks` table are blocked by which held data locks in the `data_locks` table. Held locks in `data_locks` appear in `data_lock_waits` only if they block some lock request.

This information enables you to understand data lock dependencies between sessions. The table exposes not only which lock a session or transaction is waiting for, but which session or transaction currently holds that lock.

Example data lock wait information:

```
mysql> SELECT * FROM data_lock_waits\G
*************************** 1. row ***************************
                            ENGINE: INNODB
      REQUESTING_ENGINE_LOCK_ID: 4141:66:5:2
REQUESTING_ENGINE_TRANSACTION_ID: 4141
            REQUESTING_THREAD_ID: 38
             REQUESTING_EVENT_ID: 11
REQUESTING_OBJECT_INSTANCE_BEGIN: 140489320441368
         BLOCKING_ENGINE_LOCK_ID: 4140:66:5:2
  BLOCKING_ENGINE_TRANSACTION_ID: 4140
              BLOCKING_THREAD_ID: 37
               BLOCKING_EVENT_ID: 9
  BLOCKING_OBJECT_INSTANCE_BEGIN: 140489320307736
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_lock_waits` table to help diagnose performance problems that occur during times of heavy concurrent load. For `InnoDB`, see the discussion of this topic at Section 15.14.2, “InnoDB INFORMATION_SCHEMA Transaction and Locking Information”.

Because the columns in the `data_lock_waits` table are similar to those in the `data_locks` table, the column descriptions here are abbreviated. For more detailed column descriptions, see Section 25.11.12.1, “The data_locks Table”.

The `data_lock_waits` table has these columns:

- `ENGINE`

  The storage engine that requested the lock.

- `REQUESTING_ENGINE_LOCK_ID`

  The ID of the lock requested by the storage engine. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the `data_locks` table.

- `REQUESTING_ENGINE_TRANSACTION_ID`

  The storage engine internal ID of the transaction that requested the lock.

- `REQUESTING_THREAD_ID`

  The thread ID of the session that requested the lock.

- `REQUESTING_EVENT_ID`

  The Performance Schema event that caused the lock request in the session that requested the lock.

- `REQUESTING_OBJECT_INSTANCE_BEGIN`

  The address in memory of the requested lock.

- `BLOCKING_ENGINE_LOCK_ID`

  The ID of the blocking lock. To obtain details about the lock, join this column with the `ENGINE_LOCK_ID` column of the `data_locks` table.

- `BLOCKING_ENGINE_TRANSACTION_ID`

  The storage engine internal ID of the transaction that holds the blocking lock.

- `BLOCKING_THREAD_ID`

  The thread ID of the session that holds the blocking lock.

- `BLOCKING_EVENT_ID`

  The Performance Schema event that caused the blocking lock in the session that holds it.

- `BLOCKING_OBJECT_INSTANCE_BEGIN`

  The address in memory of the blocking lock.

The `data_lock_waits` table has these indexes:

- Index on (`REQUESTING_ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`BLOCKING_ENGINE_LOCK_ID`, `ENGINE`)
- Index on (`REQUESTING_ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`BLOCKING_ENGINE_TRANSACTION_ID`, `ENGINE`)
- Index on (`REQUESTING_THREAD_ID`, `REQUESTING_EVENT_ID`)
- Index on (`BLOCKING_THREAD_ID`, `BLOCKING_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `data_lock_waits` table.

25.11.12.3 The metadata_locks Table

The Performance Schema exposes metadata lock information through the `metadata_locks` table:

- Locks that have been granted (shows which sessions own which current metadata locks)
- Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).
- Lock requests that have been killed by the deadlock detector or timed out and are waiting for the requesting session's lock request to be discarded

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The `metadata_locks` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_metadata_locks` system variable at server startup.

Metadata lock instrumentation uses the `wait/lock/metadata/sql/mdl` instrument, which is enabled by default.

To control metadata lock instrumention state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'
```

To control metadata lock instrumention state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE setup_instruments SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

- Disable:

```
UPDATE setup_instruments SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

The Performance Schema maintains `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.
- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.
- When a pending lock request times out (`ER_LOCK_WAIT_TIMEOUT`), its row status is updated from `PENDING` to `TIMEOUT`.

- When granted lock or pending lock request is killed, its row status is updated from `GRANTED` or `PENDING` to `KILLED`.
- The `VICTIM`, `TIMEOUT`, and `KILLED` status values are brief and signify that the lock row is about to be deleted.
- The `PRE_ACQUIRE_NOTIFY` and `POST_RELEASE_NOTIFY` status values are brief and signify that the metadata locking subsubsystem is notifying interested storage engines while entering lock acquisition or leaving lock release operations.

The `metadata_locks` table has these columns:

- `OBJECT_TYPE`

  The type of lock used in the metadata lock subsystem: The value is one of `GLOBAL`, `SCHEMA`, `TABLE`, `FUNCTION`, `PROCEDURE`, `TRIGGER` (currently unused), `EVENT`, `COMMIT`, `USER LEVEL LOCK`, `TABLESPACE`, or `LOCKING SERVICE`.

  A value of `USER LEVEL LOCK` indicates a lock acquired with `GET_LOCK()`. A value of `LOCKING SERVICE` indicates a lock acquired using the locking service described in Section 28.3.1, “The Locking Service”.

- `OBJECT_SCHEMA`

  The schema that contains the object.

- `OBJECT_NAME`

  The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

  The address in memory of the instrumented object.

- `LOCK_TYPE`

  The lock type from the metadata lock subsystem. The value is one of `INTENTION_EXCLUSIVE`, `SHARED`, `SHARED_HIGH_PRIO`, `SHARED_READ`, `SHARED_WRITE`, `SHARED_UPGRADABLE`, `SHARED_NO_WRITE`, `SHARED_NO_READ_WRITE`, or `EXCLUSIVE`.

- `LOCK_DURATION`

  The lock duration from the metadata lock subsystem. The value is one of `STATEMENT`, `TRANSACTION`, or `EXPLICIT`. The `STATEMENT` and `TRANSACTION` values signify locks that are released at statement or transaction end, respectively. The `EXPLICIT` value signifies locks that survive statement or transaction end and are released explicitly, such as global locks acquired with `FLUSH TABLES WITH READ LOCK`.

- `LOCK_STATUS`

  The lock status from the metadata lock subsystem. The value is one of `PENDING`, `GRANTED`, `VICTIM`, `TIMEOUT`, `KILLED`, `PRE_ACQUIRE_NOTIFY`, or `POST_RELEASE_NOTIFY`. The Performance Schema assigns these values as described previously.

- `SOURCE`

  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- `OWNER_THREAD_ID`

  The thread requesting a metadata lock.

- `OWNER_EVENT_ID`

  The event requesting a metadata lock.

The `metadata_locks` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `metadata_locks` table.

25.11.12.4 The table_handles Table

The Performance Schema exposes table lock information through the `table_handles` table to show the table locks currently in effect for each opened table handle. `table_handles` reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The `table_handles` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_table_handles` system variable at server startup.

The `table_handles` table has these columns:

- `OBJECT_TYPE`

  The table opened by a table handle.

- `OBJECT_SCHEMA`

  The schema that contains the object.

- `OBJECT_NAME`

  The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

  The table handle address in memory.

- `OWNER_THREAD_ID`

  The thread owning the table handle.

- `OWNER_EVENT_ID`

  The event which caused the table handle to be opened.

- `INTERNAL_LOCK`

  The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/thr_lock.h` source file.

- `EXTERNAL_LOCK`

  The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

The `table_handles` table has these indexes:

- Primary key on (`OBJECT_INSTANCE_BEGIN`)
- Index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- Index on (`OWNER_THREAD_ID`, `OWNER_EVENT_ID`)

`TRUNCATE TABLE` is not permitted for the `table_handles` table.

25.11.13 Performance Schema System Variable Tables

The MySQL server maintains many system variables that indicate how it is configured (see Section 5.1.5, “Server System Variables”). System variable information is available in these Performance Schema tables:

- `global_variables`: Global system variables. An application that wants only global values should use this table.
- `session_variables`: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `variables_by_thread`: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.
- `persisted_variables`: Provides a SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings. See Section 25.11.13.1, “Performance Schema persisted_variables Table”.
- `variables_info`: Shows, for each system variable, the source from which it was most recently set, and its range of values. See Section 25.11.13.2, “Performance Schema variables_info Table”.

The session variable tables (`session_variables`, `variables_by_thread`) contain information only for active sessions, not terminated sessions.

`TRUNCATE TABLE` is not supported for Performance Schema system variable tables.

The `global_variables` and `session_variables` tables have these columns:

- `VARIABLE_NAME`

  The system variable name.

- `VARIABLE_VALUE`

  The system variable value. For `global_variables`, this column contains the global value. For `session_variables`, this column contains the variable value in effect for the current session.

The `global_variables` and `session_variables` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `variables_by_thread` table has these columns:

- `THREAD_ID`

  The thread identifier of the session in which the system variable is defined.

- `VARIABLE_NAME`

  The system variable name.

- VARIABLE_VALUE

  The session variable value for the session named by the THREAD_ID column.

The variables_by_thread table has these indexes:

- Primary key on (THREAD_ID, VARIABLE_NAME)

The variables_by_thread table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the Performance_schema_thread_instances_lost status variable will be greater than zero.

25.11.13.1 Performance Schema persisted_variables Table

The persisted_variables table provides an SQL interface to the mysqld-auto.cnf file that stores persisted global system variable settings, enabling the file contents to be inspected at runtime using SELECT statements. Variables are persisted using SET PERSIST or PERSIST_ONLY statements; see Section 13.7.4.1, "SET Syntax for Variable Assignment". The table contains a row for each persisted system variable in the file. Variables not persisted do not appear in the table.

For information about persisted system variables, see Section 5.1.6, "Using System Variables".

Suppose that mysqld-auto.cnf looks like this:

```
{ "mysql_server": {"autocommit": "ON" , "max_connections": "1000" } }
```

Then persisted_variables has these contents:

```
mysql> SELECT * FROM persisted_variables;
+-----------------+----------------+
| VARIABLE_NAME   | VARIABLE_VALUE |
+-----------------+----------------+
| autocommit      | ON             |
| max_connections | 1000           |
+-----------------+----------------+
```

persisted_variables has these columns:

- VARIABLE_NAME

  The variable name listed in mysqld-auto.cnf.

- VARIABLE_VALUE

  The value listed for the variable in mysqld-auto.cnf.

persisted_variables has these indexes:

- Primary key on (VARIABLE_NAME)

TRUNCATE TABLE is not permitted for the persisted_variables table.

25.11.13.2 Performance Schema variables_info Table

The variables_info table shows, for each system variable, the source from which it was most recently set, and its range of values.

variables_info has these columns:

- VARIABLE_NAME

The variable name.

- `VARIABLE_SOURCE`

  The source from which the variable was most recently set:

  - `COMMAND_LINE`

    The variable was set on the command line.

  - `COMPILED`

    The variable has its compiled-in default value. `COMPILED` is the value used for variables not set any other way.

  - `DYNAMIC`

    The variable was set at runtime. This includes variables set within files specified using the `--init-file` option.

  - `EXPLICIT`

    The variable was set from an option file named with the `--defaults-file` option.

  - `EXTRA`

    The variable was set from an option file named with the `--defaults-extra-file` option.

  - `GLOBAL`

    The variable was set from a global option file. This includes option files not covered by `EXPLICIT`, `EXTRA`, `LOGIN`, `PERSISTED`, `SERVER`, or `USER`.

  - `LOGIN`

    The variable was set from a user-specific login path file (`~/.mylogin.cnf`).

  - `PERSISTED`

    The variable was set from a server-specific `mysqld-auto.cnf` option file. No row has this value if the server was started with `persisted_globals_load` disabled.

  - `SERVER`

    The variable was set from a server-specific `$MYSQL_HOME/my.cnf` option file. For details about how `MYSQL_HOME` is set, see Section 4.2.6, “Using Option Files”.

  - `USER`

    The variable was set from a user-specific `~/.my.cnf` option file.

- `VARIABLE_PATH`

  If the variable was set from an option file, `VARIABLE_PATH` is the path name of that file. Otherwise, the value is the empty string.

- `MIN_VALUE`, `MAX_VALUE`

  The minimum and maximum permitted values for the variable. Both are 0 for variables that have no such values (that is, variables that are not numeric).

- `SET_TIME`

The time at which the variable was most recently set. The default is the time at which the server initialized global system variables during startup.

- `SET_USER`, `SET_HOST`

  The user name and host name of the client user that most recently set the variable. If a client connects as `user17` from host `host34.example.com` using the account `'user17'@'%.example.com`, `SET_USER` and `SET_HOST` will be `user17` and `host34.example.com`, respectively. For proxy user connections, these values correspond to the external (proxy) user, not the proxied user against which privilege checking is performed. The default for each column is the empty string, indicating that the variable has not been set since server startup.

The `variables_info` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `variables_info` table.

If a variable with a `VARIABLE_SOURCE` value other than `DYNAMIC` is set at runtime, `VARIABLE_SOURCE` becomes `DYNAMIC` and `VARIABLE_PATH` becomes the empty string.

A system variable that has only a session value (such as `debug_sync`) cannot be set at startup or persisted. For session-only system variables, `VARIABLE_SOURCE` can be only `COMPILED` or `DYNAMIC`.

If a system variable has an unexpected `VARIABLE_SOURCE` value, consider your server startup method. For example, `mysqld_safe` reads option files and passes certain options it finds there as part of the command line that it uses to start `mysqld`. Consequently, some system variables that you set in option files might display in `variables_info` as `COMMAND_LINE`, rather than as `GLOBAL` or `SERVER` as you might otherwise expect.

Some sample queries that use the `variables_info` table, with representive output:

- Display variables set on the command line:

```
mysql> SELECT VARIABLE_NAME FROM variables_info
       WHERE VARIABLE_SOURCE = 'COMMAND_LINE'
       ORDER BY VARIABLE_NAME;
+---------------+
| VARIABLE_NAME |
+---------------+
| basedir       |
| datadir       |
| log_error     |
| pid_file      |
| plugin_dir    |
| port          |
+---------------+
```

- Display variables set from persistent storage:

```
mysql> SELECT VARIABLE_NAME FROM variables_info
       WHERE VARIABLE_SOURCE = 'PERSISTED'
       ORDER BY VARIABLE_NAME;
+--------------------------+
| VARIABLE_NAME            |
+--------------------------+
| event_scheduler          |
| expire_logs_days         |
| max_connections          |
| validate_password_policy |
+--------------------------+
```

- Join `variables_info` with the `global_variables` table to display the current values of persisted variables, together with their range of values:

```
mysql> SELECT
         VI.VARIABLE_NAME, GV.VARIABLE_VALUE,
         VI.MIN_VALUE,VI.MAX_VALUE
       FROM variables_info AS VI
         INNER JOIN global_variables AS GV
         USING(VARIABLE_NAME)
       WHERE VI.VARIABLE_SOURCE = 'PERSISTED'
       ORDER BY VARIABLE_NAME;
+--------------------------+----------------+-----------+-----------+
| VARIABLE_NAME            | VARIABLE_VALUE | MIN_VALUE | MAX_VALUE |
+--------------------------+----------------+-----------+-----------+
| event_scheduler          | ON             | 0         | 0         |
| expire_logs_days         | 7              | 0         | 99        |
| max_connections          | 200            | 1         | 100000    |
| validate_password_policy | STRONG         | 0         | 0         |
+--------------------------+----------------+-----------+-----------+
```

25.11.14 Performance Schema Status Variable Tables

The MySQL server maintains many status variables that provide information about its operation (see Section 5.1.7, “Server Status Variables”). Status variable information is available in these Performance Schema tables:

- `global_status`: Global status variables. An application that wants only global values should use this table.
- `session_status`: Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `status_by_thread`: Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See Section 25.11.15.12, “Status Variable Summary Tables”.

The session variable tables (`session_status`, `status_by_thread`) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the `INSTRUMENTED` value is `YES` in the `threads` table. Statistics for session status variables are always collected, regardless of the `INSTRUMENTED` value.

The Performance Schema does not collect statistics for `Com_xxx` status variables in the status variable tables. To obtain global and per-session statement execution counts, use the `events_statements_summary_global_by_event_name` and `events_statements_summary_by_thread_by_event_name` tables, respectively. For example:

```
SELECT EVENT_NAME, COUNT_STAR
FROM events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql/%';
```

The `global_status` and `session_status` tables have these columns:

- `VARIABLE_NAME`

  The status variable name.

- `VARIABLE_VALUE`

  The status variable value. For `global_status`, this column contains the global value. For `session_status`, this column contains the variable value for the current session.

The `global_status` and `session_status` tables have these indexes:

- Primary key on (`VARIABLE_NAME`)

The `status_by_thread` table contains the status of each active thread. It has these columns:

- `THREAD_ID`

  The thread identifier of the session in which the status variable is defined.

- `VARIABLE_NAME`

  The status variable name.

- `VARIABLE_VALUE`

  The session variable value for the session named by the `THREAD_ID` column.

The `status_by_thread` table has these indexes:

- Primary key on (`THREAD_ID`, `VARIABLE_NAME`)

The `status_by_thread` table contains status variable information only about foreground threads. If the `performance_schema_max_thread_instances` system variable is not autoscaled (set to −1) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table will be empty.

The Performance Schema supports `TRUNCATE TABLE` for status variable tables as follows:

- `global_status`: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- `session_status`: Not supported.
- `status_by_thread`: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

  Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

25.11.15 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

Wait Event Summaries

- `events_waits_summary_by_account_by_event_name`: Wait events per account and event name
- `events_waits_summary_by_host_by_event_name`: Wait events per host name and event name
- `events_waits_summary_by_instance`: Wait events per instance
- `events_waits_summary_by_thread_by_event_name`: Wait events per thread and event name

- `events_waits_summary_by_user_by_event_name`: Wait events per user name and event name
- `events_waits_summary_global_by_event_name`: Wait events per event name

Stage Summaries

- `events_stages_summary_by_account_by_event_name`: Stage events per account and event name
- `events_stages_summary_by_host_by_event_name`: Stage events per host name and event name
- `events_stages_summary_by_thread_by_event_name`: Stage waits per thread and event name
- `events_stages_summary_by_user_by_event_name`: Stage events per user name and event name
- `events_stages_summary_global_by_event_name`: Stage waits per event name

Statement Summaries

- `events_statements_histogram_by_digest`: Statement histograms per schema and digest value.
- `events_statements_histogram_global`: Statement histogram summarized globally.
- `events_statements_summary_by_account_by_event_name`: Statement events per account and event name
- `events_statements_summary_by_digest`: Statement events per schema and digest value
- `events_statements_summary_by_host_by_event_name`: Statement events per host name and event name
- `events_statements_summary_by_program`: Statement events per stored program (stored procedures and functions, triggers, and events)
- `events_statements_summary_by_thread_by_event_name`: Statement events per thread and event name
- `events_statements_summary_by_user_by_event_name`: Statement events per user name and event name
- `events_statements_summary_global_by_event_name`: Statement events per event name
- `prepared_statements_instances`: Prepared statement instances and statistics

Transaction Summaries

- `events_transactions_summary_by_account_by_event_name`: Transaction events per account and event name
- `events_transactions_summary_by_host_by_event_name`: Transaction events per host name and event name
- `events_transactions_summary_by_thread_by_event_name`: Transaction events per thread and event name
- `events_transactions_summary_by_user_by_event_name`: Transaction events per user name and event name

- `events_transactions_summary_global_by_event_name`: Transaction events per event name

Object Wait Summaries

- `objects_summary_global_by_type`: Object summaries

File I/O Summaries

- `file_summary_by_event_name`: File events per event name
- `file_summary_by_instance`: File events per file instance

Table I/O and Lock Wait Summaries

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

Socket Summaries

- `socket_summary_by_instance`: Socket waits and I/O per instance
- `socket_summary_by_event_name`: Socket waits and I/O per event name

Memory Summaries

- `memory_summary_by_account_by_event_name`: Memory operations per account and event name
- `memory_summary_by_host_by_event_name`: Memory operations per host and event name
- `memory_summary_by_thread_by_event_name`: Memory operations per thread and event name
- `memory_summary_by_user_by_event_name`: Memory operations per user and event name
- `memory_summary_global_by_event_name`: Memory operations globally per event name

Error Summaries

- `events_errors_summary_by_account_by_error`: Errors per error code and account
- `events_errors_summary_by_host_by_error`: Errors per error code and host
- `events_errors_summary_by_thread_by_error`: Errors per error code and thread
- `events_errors_summary_by_user_by_error`: Errors per error code and user
- `events_errors_summary_global_by_error`: Errors per error code

Status Variable Summaries

- `status_by_account`: Status variables per account
- `status_by_host`: Status variables per host name
- `status_by_user`: Status variables per user name

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar

ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

25.11.15.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. Section 25.11.4, “Performance Schema Wait Event Tables” describes the events on which wait summaries are based. See that discussion for information about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```
mysql> SELECT * FROM events_waits_summary_global_by_event_name\G
...
*************************** 6. row ***************************
    EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
    COUNT_STAR: 8
SUM_TIMER_WAIT: 2119302
MIN_TIMER_WAIT: 196092
AVG_TIMER_WAIT: 264912
MAX_TIMER_WAIT: 569421
...
*************************** 9. row ***************************
    EVENT_NAME: wait/synch/mutex/sql/hash_filo::lock
    COUNT_STAR: 69
SUM_TIMER_WAIT: 16848828
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 244185
MAX_TIMER_WAIT: 735345
...
```

Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_waits_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_waits_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_waits_summary_by_instance` has `EVENT_NAME` and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique `OBJECT_INSTANCE_BEGIN` value and is summarized separately in this table.
- `events_waits_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_waits_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_waits_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is

created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- `COUNT_STAR`

  The number of summarized events. This value includes all events, whether timed or nontimed.

- `SUM_TIMER_WAIT`

  The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of `NULL`. The same is true for the other *`xxx`*`_TIMER_WAIT` values.

- `MIN_TIMER_WAIT`

  The minimum wait time of the summarized timed events.

- `AVG_TIMER_WAIT`

  The average wait time of the summarized timed events.

- `MAX_TIMER_WAIT`

  The maximum wait time of the summarized timed events.

The wait event summary tables have these indexes:

- `events_waits_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_waits_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_waits_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)
- `events_waits_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_waits_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_waits_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation

of `events_waits_summary_global_by_event_name`. For details, see Section 25.11.8, “Performance Schema Connection Tables”.

25.11.15.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. Section 25.11.5, “Performance Schema Stage Event Tables” describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and recent stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```
mysql> SELECT * FROM events_stages_summary_global_by_event_name\G
...
*************************** 5. row ***************************
    EVENT_NAME: stage/sql/checking permissions
    COUNT_STAR: 57
SUM_TIMER_WAIT: 26501888880
MIN_TIMER_WAIT: 7317456
AVG_TIMER_WAIT: 464945295
MAX_TIMER_WAIT: 12858936792
...
*************************** 9. row ***************************
    EVENT_NAME: stage/sql/closing tables
    COUNT_STAR: 37
SUM_TIMER_WAIT: 662606568
MIN_TIMER_WAIT: 1593864
AVG_TIMER_WAIT: 17907891
MAX_TIMER_WAIT: 437977248
...
```

Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see Section 25.11.15.1, “Wait Event Summary Tables”), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

The stage summary tables have these indexes:

- `events_stages_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_stages_summary_by_host_by_event_name`:

  - Primary key on (HOST, EVENT_NAME)
- events_stages_summary_by_thread_by_event_name:
  - Primary key on (THREAD_ID, EVENT_NAME)
- events_stages_summary_by_user_by_event_name:
  - Primary key on (USER, EVENT_NAME)
- events_stages_summary_global_by_event_name:
  - Primary key on (EVENT_NAME)

TRUNCATE TABLE is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of events_stages_summary_global_by_event_name. For details, see Section 25.11.8, "Performance Schema Connection Tables".

25.11.15.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. Section 25.11.6, "Performance Schema Statement Event Tables" describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and recent statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT * FROM events_statements_summary_global_by_event_name\G
*************************** 1. row ***************************
                EVENT_NAME: statement/sql/select
                COUNT_STAR: 25
            SUM_TIMER_WAIT: 1535983999000
            MIN_TIMER_WAIT: 209823000
            AVG_TIMER_WAIT: 61439359000
            MAX_TIMER_WAIT: 1363397650000
             SUM_LOCK_TIME: 20186000000
                SUM_ERRORS: 0
              SUM_WARNINGS: 0
         SUM_ROWS_AFFECTED: 0
             SUM_ROWS_SENT: 388
         SUM_ROWS_EXAMINED: 370
SUM_CREATED_TMP_DISK_TABLES: 0
     SUM_CREATED_TMP_TABLES: 0
       SUM_SELECT_FULL_JOIN: 0
 SUM_SELECT_FULL_RANGE_JOIN: 0
           SUM_SELECT_RANGE: 0
     SUM_SELECT_RANGE_CHECK: 0
            SUM_SELECT_SCAN: 6
      SUM_SORT_MERGE_PASSES: 0
             SUM_SORT_RANGE: 0
              SUM_SORT_ROWS: 0
              SUM_SORT_SCAN: 0
          SUM_NO_INDEX_USED: 6
     SUM_NO_GOOD_INDEX_USED: 0
...
```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_statements_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_statements_summary_by_digest` has `SCHEMA_NAME` and `DIGEST` columns. Each row summarizes events per schema and digest value. (The `DIGEST_TEXT` column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column. The `QUERY_SAMPLE_TEXT`, `QUERY_SAMPLE_SEEN`, and `QUERY_SAMPLE_TIMER_WAIT` columns also are neither grouping nor summary columns; they support statement sampling.)

  The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the `performance_schema_digests_size` system variable at server startup.
- `events_statements_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_statements_summary_by_program` has `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME` columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).
- `events_statements_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_statements_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_statements_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `prepared_statements_instances` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns are analogous to the columns of the same names in the wait event summary tables (see Section 25.11.15.1, “Wait Event Summary Tables”), except that the statement summary tables aggregate events from `events_statements_current` rather than `events_waits_current`.

  The `prepared_statements_instances` table does not have these columns.
- `SUM_`*`xxx`*

  The aggregate of the corresponding *`xxx`* column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

  Timestamps indicating when statements with the given digest value were first seen and most recently seen.
- `QUANTILE_95`: The 95th percentile of the statement latency, in picoseconds. This percentile is a high estimate, computed from the histogram data collected. In other words, for a given digest, 95% of the statements measured have a latency lower than `QUANTILE_95`.

For access to the histogram data, use the tables described in Section 25.11.15.4, “Statement Histogram Summary Tables”.

- `QUANTILE_99`: Similar to `QUANTILE_95`, but for the 99th percentile.
- `QUANTILE_999`: Similar to `QUANTILE_95`, but for the 99.9th percentile.

As of MySQL 8.0.3, the `events_statements_summary_by_digest` table contains the following columns. These are neither grouping nor summary columns; they support statement sampling:

- `QUERY_SAMPLE_TEXT`

  A sample SQL statement that produces the digest value in the row. This column enables applications to access, for a given digest value, a statement actually seen by the server that produces that digest. One use for this might be to run `EXPLAIN` on the statement to examine the execution plan for a representative statement associated with a frequently occurring digest.

  When the `QUERY_SAMPLE_TEXT` column is assigned a value, the `QUERY_SAMPLE_SEEN` and `QUERY_SAMPLE_TIMER_WAIT` columns are assigned values as well.

  The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See Section 25.9, “Performance Schema Statement Digests and Sampling”.)

  For information about statement sampling, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

  This column was added in MySQL 8.0.3.

- `QUERY_SAMPLE_SEEN`

  A timestamp indicating when the statement in the `QUERY_SAMPLE_TEXT` column was seen.

  This column was added in MySQL 8.0.3.

- `QUERY_SAMPLE_TIMER_WAIT`

  The wait time for the sample statement in the `QUERY_SAMPLE_TEXT` column.

  This column was added in MySQL 8.0.3.

The `events_statements_summary_by_program` table has these additional summary columns:

- `COUNT_STATEMENTS`, `SUM_STATEMENTS_WAIT`, `MIN_STATEMENTS_WAIT`, `AVG_STATEMENTS_WAIT`, `MAX_STATEMENTS_WAIT`

  Statistics about nested statements invoked during stored program execution.

The `prepared_statements_instances` table has these additional summary columns:

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

  Aggregated statistics for executions of the prepared statement.

The statement summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)

- `events_statements_summary_by_digest`:
  - Primary key on (`SCHEMA_NAME`, `DIGEST`)
- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_statements_summary_by_program`:
  - Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)
- `events_statements_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `events_statements_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for statement summary tables. It has these effects:

- For `events_statements_summary_by_digest`, it removes the rows.
- For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_statements_summary_global_by_event_name`. For details, see Section 25.11.8, “Performance Schema Connection Tables”.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

Statement Digest Aggregation Rules

If the `statements_digest` consumer is enabled, aggregation into `events_statements_summary_by_digest` occurs as follows when a statement completes. Aggregation is based on the `DIGEST` value computed for the statement.

- If a `events_statements_summary_by_digest` row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The `LAST_SEEN` column is updated to the current time.
- If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time.
- If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with `DIGEST` = `NULL`, which is created if necessary. If the row is created, the `FIRST_SEEN` and `LAST_SEEN`

columns are initialized with the current time. Otherwise, the `LAST_SEEN` column is updated with the current time.

The row with `DIGEST` = `NULL` is maintained because Performance Schema tables have a maximum size due to memory constraints. The `DIGEST` = `NULL` row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

- A `DIGEST` = `NULL` row that has a `COUNT_STAR` value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.
- A `DIGEST` = `NULL` row that has a `COUNT_STAR` value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted in the `DIGEST` = `NULL` row would be counted using more specific rows instead. To do this, set the `performance_schema_digests_size` system variable to a larger value at server startup. The default size is 200.

Stored Program Instrumentation Behavior

For stored program types for which instrumentation is enabled in the `setup_objects` table, `events_statements_summary_by_program` maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also Section 25.4.3, “Event Pre-Filtering”.

25.11.15.4 Statement Histogram Summary Tables

The Performance Schema maintains statement event summary tables that contain information about minimum, maximum, and average statement latency (see Section 25.11.15.3, “Statement Summary Tables”). Those tables permit high-level assessment of system performance. To permit assessment at a more fine-grained level, the Performance Schema also collects histogram data for statement latencies. These histograms provide additional insight into latency distributions.

Section 25.11.6, “Performance Schema Statement Event Tables” describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and recent statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement histogram information:

```
mysql> SELECT * FROM events_statements_histogram_by_digest
       WHERE SCHEMA_NAME = 'mydb' AND DIGEST = 'bb3f69453119b2d7b3ae40673a9d4c7c'
       AND COUNT_BUCKET > 0 ORDER BY BUCKET_NUMBER\G
*************************** 1. row ***************************
           SCHEMA_NAME: mydb
                DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
         BUCKET_NUMBER: 42
      BUCKET_TIMER_LOW: 66069344
     BUCKET_TIMER_HIGH: 69183097
          COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 1
       BUCKET_QUANTILE: 0.058824
*************************** 2. row ***************************
           SCHEMA_NAME: mydb
                DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
         BUCKET_NUMBER: 43
```

```
      BUCKET_TIMER_LOW: 69183097
     BUCKET_TIMER_HIGH: 72443596
          COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 2
       BUCKET_QUANTILE: 0.117647
*************************** 3. row ***************************
           SCHEMA_NAME: mydb
                DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
         BUCKET_NUMBER: 44
      BUCKET_TIMER_LOW: 72443596
     BUCKET_TIMER_HIGH: 75857757
          COUNT_BUCKET: 2
COUNT_BUCKET_AND_LOWER: 4
       BUCKET_QUANTILE: 0.235294
*************************** 4. row ***************************
           SCHEMA_NAME: mydb
                DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
         BUCKET_NUMBER: 45
      BUCKET_TIMER_LOW: 75857757
     BUCKET_TIMER_HIGH: 79432823
          COUNT_BUCKET: 6
COUNT_BUCKET_AND_LOWER: 10
       BUCKET_QUANTILE: 0.625000
...
```

For example, in row 3, these values indicate that 23.52% of queries run in under 75.86 microseconds:

```
BUCKET_TIMER_HIGH: 75857757
  BUCKET_QUANTILE: 0.235294
```

In row 4, these values indicate that 62.50% of queries run in under 79.44 microseconds:

```
BUCKET_TIMER_HIGH: 79432823
  BUCKET_QUANTILE: 0.625000
```

Each statement histogram summary table has one or more grouping columns to indicate how the table aggregates events:

- `events_statements_histogram_by_digest` has `SCHEMA_NAME`, `DIGEST`, and `BUCKET_NUMBER` columns:
  - The `SCHEMA_NAME` and `DIGEST` columns identify a statement digest row in the `events_statements_summary_by_digest` table.
  - The `events_statements_histogram_by_digest` rows with the same `SCHEMA_NAME` and `DIGEST` values comprise the histogram for that schema/digest combination.
  - Within a given histogram, the `BUCKET_NUMBER` column indicates the bucket number.
- `events_statements_histogram_global` has a `BUCKET_NUMBER` column. This table summarizes latencies globally across schema name and digest values, using a single histogram. The `BUCKET_NUMBER` column indicates the bucket number within this global histogram.

A histogram consists of *`N`* buckets, where each row represents one bucket, with the bucket number indicated by the `BUCKET_NUMBER` column. Bucket numbers begin with 0.

Each statement histogram summary table has these summary columns containing aggregated values:

- `BUCKET_TIMER_LOW`, `BUCKET_TIMER_HIGH`

  A bucket counts statements that have a latency, in picoseconds, measured between `BUCKET_TIMER_LOW` and `BUCKET_TIMER_HIGH`:

  - The value of `BUCKET_TIMER_LOW` for the first bucket (`BUCKET_NUMBER` = 0) is 0.

  - The value of `BUCKET_TIMER_LOW` for a bucket (`BUCKET_NUMBER` = *k*) is the same as `BUCKET_TIMER_HIGH` for the previous bucket (`BUCKET_NUMBER` = *k*−1)
  - The last bucket is a catchall for statements that have a latency exceeding previous buckets in the histogram.

- `COUNT_BUCKET`

  The number of statements measured with a latency in the interval from `BUCKET_TIMER_LOW` up to but not including `BUCKET_TIMER_HIGH`.

- `COUNT_BUCKET_AND_LOWER`

  The number of statements measured with a latency in the interval from 0 up to but not including `BUCKET_TIMER_HIGH`.

- `BUCKET_QUANTILE`

  The proportion of statements that fall into this or a lower bucket. This proportion corresponds by definition to `COUNT_BUCKET_AND_LOWER / SUM(COUNT_BUCKET)` and is displayed as a convenience column.

The statement histogram summary tables have these indexes:

- `events_statements_histogram_by_digest`:
  - Unique index on (`SCHEMA_NAME`, `DIGEST`, `BUCKET_NUMBER`)
- `events_statements_histogram_global`:
  - Primary key on (`BUCKET_NUMBER`)

`TRUNCATE TABLE` is permitted for statement histogram summary tables. Truncation sets the `COUNT_BUCKET` and `COUNT_BUCKET_AND_LOWER` columns to 0.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

25.11.15.5 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. Section 25.11.7, “Performance Schema Transaction Tables” describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and recent transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```
mysql> SELECT * FROM events_transactions_summary_global_by_event_name LIMIT 1\G
*************************** 1. row ***************************
          EVENT_NAME: transaction
          COUNT_STAR: 5
      SUM_TIMER_WAIT: 19550092000
      MIN_TIMER_WAIT: 2954148000
      AVG_TIMER_WAIT: 3910018000
      MAX_TIMER_WAIT: 5486275000
    COUNT_READ_WRITE: 5
SUM_TIMER_READ_WRITE: 19550092000
MIN_TIMER_READ_WRITE: 2954148000
AVG_TIMER_READ_WRITE: 3910018000
```

```
MAX_TIMER_READ_WRITE: 5486275000
     COUNT_READ_ONLY: 0
 SUM_TIMER_READ_ONLY: 0
 MIN_TIMER_READ_ONLY: 0
 AVG_TIMER_READ_ONLY: 0
 MAX_TIMER_READ_ONLY: 0
```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_transactions_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_transactions_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.
- `events_transactions_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_transactions_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `events_transactions_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns are analogous to the columns of the same names in the wait event summary tables (see Section 25.11.15.1, “Wait Event Summary Tables”), except that the transaction summary tables aggregate events from `events_transactions_current` rather than `events_waits_current`. These columns summarize read-write and read-only transactions.

- `COUNT_READ_WRITE`, `SUM_TIMER_READ_WRITE`, `MIN_TIMER_READ_WRITE`, `AVG_TIMER_READ_WRITE`, `MAX_TIMER_READ_WRITE`

  These are similar to the `COUNT_STAR` and *`xxx`*`_TIMER_WAIT` columns, but summarize read-write transactions only.

- `COUNT_READ_ONLY`, `SUM_TIMER_READ_ONLY`, `MIN_TIMER_READ_ONLY`, `AVG_TIMER_READ_ONLY`, `MAX_TIMER_READ_ONLY`

  These are similar to the `COUNT_STAR` and *`xxx`*`_TIMER_WAIT` columns, but summarize read-only transactions only.

The transaction summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `events_transactions_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `events_transactions_summary_by_user_by_event_name`:

  - Primary key on (USER, EVENT_NAME)

- events_transactions_summary_global_by_event_name:

  - Primary key on (EVENT_NAME)

TRUNCATE TABLE is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of events_transactions_summary_global_by_event_name. For details, see Section 25.11.8, "Performance Schema Connection Tables".

Transaction Aggregation Rules

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

25.11.15.6 Object Wait Summary Table

The Performance Schema maintains the objects_summary_global_by_type table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM objects_summary_global_by_type\G
...
*************************** 3. row ***************************
   OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: test
   OBJECT_NAME: t
    COUNT_STAR: 3
SUM_TIMER_WAIT: 263126976
MIN_TIMER_WAIT: 1522272
AVG_TIMER_WAIT: 87708678
MAX_TIMER_WAIT: 258428280
...
*************************** 10. row ***************************
   OBJECT_TYPE: TABLE
 OBJECT_SCHEMA: mysql
   OBJECT_NAME: user
    COUNT_STAR: 14
SUM_TIMER_WAIT: 365567592
MIN_TIMER_WAIT: 1141704
AVG_TIMER_WAIT: 26111769
MAX_TIMER_WAIT: 334783032
...
```

The objects_summary_global_by_type table has these grouping columns to indicate how the table aggregates events: OBJECT_TYPE, OBJECT_SCHEMA, and OBJECT_NAME. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_xxx` tables. See Section 25.11.15.1, “Wait Event Summary Tables”.

The `objects_summary_global_by_type` table has these indexes:

- Primary key on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

25.11.15.7 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```
mysql> SELECT * FROM file_summary_by_event_name\G
...
*************************** 2. row ***************************
               EVENT_NAME: wait/io/file/sql/binlog
               COUNT_STAR: 31
           SUM_TIMER_WAIT: 8243784888
           MIN_TIMER_WAIT: 0
           AVG_TIMER_WAIT: 265928484
           MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM file_summary_by_instance\G
...
*************************** 2. row ***************************
                FILE_NAME: /var/mysql/share/english/errmsg.sys
               EVENT_NAME: wait/io/file/sql/ERRMSG
               EVENT_NAME: wait/io/file/sql/ERRMSG
    OBJECT_INSTANCE_BEGIN: 4686193384
               COUNT_STAR: 5
           SUM_TIMER_WAIT: 13990154448
           MIN_TIMER_WAIT: 26349624
           AVG_TIMER_WAIT: 2798030607
           MAX_TIMER_WAIT: 8150662536
...
```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns aggregate all I/O operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

  These columns aggregate all read operations, including `FGETS`, `FGETC`, `FREAD`, and `READ`.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all write operations, including FPUTS, FPUTC, FPRINTF, VFPRINTF, FWRITE, and PWRITE.

- COUNT_MISC, SUM_TIMER_MISC, MIN_TIMER_MISC, AVG_TIMER_MISC, MAX_TIMER_MISC

  These columns aggregate all other I/O operations, including CREATE, DELETE, OPEN, CLOSE, STREAM_OPEN, STREAM_CLOSE, SEEK, TELL, FLUSH, STAT, FSTAT, CHSIZE, RENAME, and SYNC. There are no byte counts for these operations.

The file I/O summary tables have these indexes:

- file_summary_by_event_name:
  - Primary key on (EVENT_NAME)
- file_summary_by_instance:
  - Primary key on (OBJECT_INSTANCE_BEGIN)
  - Index on (FILE_NAME)
  - Index on (EVENT_NAME)

TRUNCATE TABLE is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events will not. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

25.11.15.8 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- table_io_waits_summary_by_index_usage: Table I/O waits per index
- table_io_waits_summary_by_table: Table I/O waits per table
- table_lock_waits_summary_by_table: Table lock waits per table

The table_io_waits_summary_by_table Table

The table_io_waits_summary_by_table table aggregates all table I/O wait events, as generated by the wait/io/table/sql/handler instrument. The grouping is by table.

The table_io_waits_summary_by_table table has these grouping columns to indicate how the table aggregates events: OBJECT_TYPE, OBJECT_SCHEMA, and OBJECT_NAME. These columns have the same meaning as in the events_waits_current table. They identify the table to which the row applies.

table_io_waits_summary_by_table has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- COUNT_STAR, SUM_TIMER_WAIT, MIN_TIMER_WAIT, AVG_TIMER_WAIT, MAX_TIMER_WAIT

  These columns aggregate all I/O operations. They are the same as the sum of the corresponding *xxx*_READ and *xxx*_WRITE columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

  These columns aggregate all read operations. They are the same as the sum of the corresponding *`xxx`*`_FETCH` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

  These columns aggregate all write operations. They are the same as the sum of the corresponding *`xxx`*`_INSERT`, *`xxx`*`_UPDATE`, and *`xxx`*`_DELETE` columns.

- `COUNT_FETCH`, `SUM_TIMER_FETCH`, `MIN_TIMER_FETCH`, `AVG_TIMER_FETCH`, `MAX_TIMER_FETCH`

  These columns aggregate all fetch operations.

- `COUNT_INSERT`, `SUM_TIMER_INSERT`, `MIN_TIMER_INSERT`, `AVG_TIMER_INSERT`, `MAX_TIMER_INSERT`

  These columns aggregate all insert operations.

- `COUNT_UPDATE`, `SUM_TIMER_UPDATE`, `MIN_TIMER_UPDATE`, `AVG_TIMER_UPDATE`, `MAX_TIMER_UPDATE`

  These columns aggregate all update operations.

- `COUNT_DELETE`, `SUM_TIMER_DELETE`, `MIN_TIMER_DELETE`, `AVG_TIMER_DELETE`, `MAX_TIMER_DELETE`

  These columns aggregate all delete operations.

The `table_io_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the `table_io_waits_summary_by_index_usage` table.

The table_io_waits_summary_by_index_usage Table

The `table_io_waits_summary_by_index_usage` table aggregates all table index I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table index.

The columns of `table_io_waits_summary_by_index_usage` are nearly identical to `table_io_waits_summary_by_table`. The only difference is the additional group column, `INDEX_NAME`, which corresponds to the name of the index that was used when the table I/O wait event was recorded:

- A value of `PRIMARY` indicates that table I/O used the primary index.
- A value of `NULL` means that table I/O used no index.
- Inserts are counted against `INDEX_NAME = NULL`.

The `table_io_waits_summary_by_index_usage` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`, `INDEX_NAME`)

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the `table_io_waits_summary_by_table` table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

The table_lock_waits_summary_by_table Table

The `table_lock_waits_summary_by_table` table aggregates all table lock wait events, as generated by the `wait/lock/table/sql/handler` instrument. The grouping is by table.

This table contains information about internal and external locks:

- An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to `thr_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read normal
read with shared locks
read high priority
read no insert
write allow write
write concurrent insert
write delayed
write low priority
write normal
```

- An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to `handler::external_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```
read external
write external
```

The `table_lock_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_lock_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns aggregate all lock operations. They are the same as the sum of the corresponding *`xxx`*`_READ` and *`xxx`*`_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

  These columns aggregate all read-lock operations. They are the same as the sum of the corresponding *`xxx`*`_READ_NORMAL`, *`xxx`*`_READ_WITH_SHARED_LOCKS`, *`xxx`*`_READ_HIGH_PRIORITY`, and *`xxx`*`_READ_NO_INSERT` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

  These columns aggregate all write-lock operations. They are the same as the sum of the corresponding *`xxx`*`_WRITE_ALLOW_WRITE`, *`xxx`*`_WRITE_CONCURRENT_INSERT`, *`xxx`*`_WRITE_LOW_PRIORITY`, and *`xxx`*`_WRITE_NORMAL` columns.

- `COUNT_READ_NORMAL`, `SUM_TIMER_READ_NORMAL`, `MIN_TIMER_READ_NORMAL`, `AVG_TIMER_READ_NORMAL`, `MAX_TIMER_READ_NORMAL`

  These columns aggregate internal read locks.

- `COUNT_READ_WITH_SHARED_LOCKS`, `SUM_TIMER_READ_WITH_SHARED_LOCKS`, `MIN_TIMER_READ_WITH_SHARED_LOCKS`, `AVG_TIMER_READ_WITH_SHARED_LOCKS`, `MAX_TIMER_READ_WITH_SHARED_LOCKS`

  These columns aggregate internal read locks.

- `COUNT_READ_HIGH_PRIORITY`, `SUM_TIMER_READ_HIGH_PRIORITY`, `MIN_TIMER_READ_HIGH_PRIORITY`, `AVG_TIMER_READ_HIGH_PRIORITY`, `MAX_TIMER_READ_HIGH_PRIORITY`

  These columns aggregate internal read locks.

- `COUNT_READ_NO_INSERT`, `SUM_TIMER_READ_NO_INSERT`, `MIN_TIMER_READ_NO_INSERT`, `AVG_TIMER_READ_NO_INSERT`, `MAX_TIMER_READ_NO_INSERT`

  These columns aggregate internal read locks.

- `COUNT_READ_EXTERNAL`, `SUM_TIMER_READ_EXTERNAL`, `MIN_TIMER_READ_EXTERNAL`, `AVG_TIMER_READ_EXTERNAL`, `MAX_TIMER_READ_EXTERNAL`

  These columns aggregate external read locks.

- `COUNT_WRITE_ALLOW_WRITE`, `SUM_TIMER_WRITE_ALLOW_WRITE`, `MIN_TIMER_WRITE_ALLOW_WRITE`, `AVG_TIMER_WRITE_ALLOW_WRITE`, `MAX_TIMER_WRITE_ALLOW_WRITE`

  These columns aggregate internal write locks.

- `COUNT_WRITE_CONCURRENT_INSERT`, `SUM_TIMER_WRITE_CONCURRENT_INSERT`, `MIN_TIMER_WRITE_CONCURRENT_INSERT`, `AVG_TIMER_WRITE_CONCURRENT_INSERT`, `MAX_TIMER_WRITE_CONCURRENT_INSERT`

  These columns aggregate internal write locks.

- `COUNT_WRITE_LOW_PRIORITY`, `SUM_TIMER_WRITE_LOW_PRIORITY`, `MIN_TIMER_WRITE_LOW_PRIORITY`, `AVG_TIMER_WRITE_LOW_PRIORITY`, `MAX_TIMER_WRITE_LOW_PRIORITY`

  These columns aggregate internal write locks.

- `COUNT_WRITE_NORMAL`, `SUM_TIMER_WRITE_NORMAL`, `MIN_TIMER_WRITE_NORMAL`, `AVG_TIMER_WRITE_NORMAL`, `MAX_TIMER_WRITE_NORMAL`

  These columns aggregate internal write locks.

- `COUNT_WRITE_EXTERNAL`, `SUM_TIMER_WRITE_EXTERNAL`, `MIN_TIMER_WRITE_EXTERNAL`, `AVG_TIMER_WRITE_EXTERNAL`, `MAX_TIMER_WRITE_EXTERNAL`

  These columns aggregate external write locks.

The `table_lock_waits_summary_by_table` table has these indexes:

- Unique index on (`OBJECT_TYPE`, `OBJECT_SCHEMA`, `OBJECT_NAME`)

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

25.11.15.9 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.

- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see Section 25.11.15.1, "Wait Event Summary Tables".

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `socket_summary_by_instance` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns aggregate all operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

  These columns aggregate all receive operations (`RECV`, `RECVFROM`, and `RECVMSG`).

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

  These columns aggregate all send operations (`SEND`, `SENDTO`, and `SENDMSG`).

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

  These columns aggregate all other socket operations, such as `CONNECT`, `LISTEN`, `ACCEPT`, `CLOSE`, and `SHUTDOWN`. There are no byte counts for these operations.

The `socket_summary_by_instance` table also has an `EVENT_NAME` column that indicates the class of the socket: `client_connection`, `server_tcpip_socket`, `server_unix_socket`. This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

The socket summary tables have these indexes:

- `socket_summary_by_event_name`:
  - Primary key on (`EVENT_NAME`)
- `socket_summary_by_instance`:
  - Primary key on (`OBJECT_INSTANCE_BEGIN`)
  - Index on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for socket summary tables. Except for `events_statements_summary_by_digest`, tt resets the summary columns to zero rather than removing rows.

25.11.15.10 Memory Summary Tables

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see Memory Instrumentation Behavior.

Example memory event summary information:

```
mysql> SELECT * FROM memory_summary_global_by_event_name
       WHERE EVENT_NAME = 'memory/sql/TABLE'\G
*************************** 1. row ***************************
                EVENT_NAME: memory/sql/TABLE
               COUNT_ALLOC: 1381
                COUNT_FREE: 924
  SUM_NUMBER_OF_BYTES_ALLOC: 2059873
   SUM_NUMBER_OF_BYTES_FREE: 1407432
             LOW_COUNT_USED: 0
         CURRENT_COUNT_USED: 457
            HIGH_COUNT_USED: 461
   LOW_NUMBER_OF_BYTES_USED: 0
CURRENT_NUMBER_OF_BYTES_USED: 652441
  HIGH_NUMBER_OF_BYTES_USED: 669269
```

Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `memory_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `memory_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.
- `memory_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `memory_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `memory_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- `COUNT_ALLOC`, `COUNT_FREE`

The aggregated numbers of calls to memory-allocation and memory-free functions.

- `SUM_NUMBER_OF_BYTES_ALLOC`, `SUM_NUMBER_OF_BYTES_FREE`

  The aggregated sizes of allocated and freed memory blocks.

- `CURRENT_COUNT_USED`

  The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to `COUNT_ALLOC` − `COUNT_FREE`.

- `CURRENT_NUMBER_OF_BYTES_USED`

  The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to `SUM_NUMBER_OF_BYTES_ALLOC` − `SUM_NUMBER_OF_BYTES_FREE`.

- `LOW_COUNT_USED`, `HIGH_COUNT_USED`

  The low and high water marks corresponding to the `CURRENT_COUNT_USED` column.

- `LOW_NUMBER_OF_BYTES_USED`, `HIGH_NUMBER_OF_BYTES_USED`

  The low and high water marks corresponding to the `CURRENT_NUMBER_OF_BYTES_USED` column.

The memory summary tables have these indexes:

- `memory_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)
- `memory_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)
- `memory_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
- `memory_summary_by_user_by_event_name`:
  - Primary key on (`USER`, `EVENT_NAME`)
- `memory_summary_global_by_event_name`:
  - Primary key on (`EVENT_NAME`)

`TRUNCATE TABLE` is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- `COUNT_ALLOC` and `COUNT_FREE` are reset to a new baseline, by reducing each counter by the same value.
- Likewise, `SUM_NUMBER_OF_BYTES_ALLOC` and `SUM_NUMBER_OF_BYTES_FREE` are reset to a new baseline.
- `LOW_COUNT_USED` and `HIGH_COUNT_USED` are reset to `CURRENT_COUNT_USED`.
- `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` are reset to `CURRENT_NUMBER_OF_BYTES_USED`.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of

`memory_summary_global_by_event_name`. For details, see Section 25.11.8, “Performance Schema Connection Tables”.

Memory Instrumentation Behavior

Memory instruments are listed in the `setup_instruments` table and have names of the form `memory/code_area/instrument_name`. Memory instrumentation is enabled by default.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema itself. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table.

To control memory instrumention state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='memory/%=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='memory/%=OFF'
```

To control memory instrumention state at runtime, update the `ENABLED` column of the relevant instruments in the `setup_instruments` table:

- Enable:

```
UPDATE setup_instruments SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

- Disable:

```
UPDATE setup_instruments SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the `TIMED` column in `setup_instruments` is ignored because memory operations are not timed.

Note

If disabled memory instrumentation is later enabled, accounting may result in an apparently negative allocation from missing an allocation operation but counting a free operation.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a thread is instrumented, and a memory block is not instrumented, the free operation is not instrumented; no statistics are changed.

- If a thread is not instrumented, and a memory block is instrumented, the free operation is instrumented, and statistics are changed.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size *N* is allocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_ALLOC`: Increased by 1
- `CURRENT_COUNT_USED`: Increased by 1
- `HIGH_COUNT_USED`: Increased if `CURRENT_COUNT_USED` is a new maximum
- `SUM_NUMBER_OF_BYTES_ALLOC`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Increased by *N*
- `HIGH_NUMBER_OF_BYTES_USED`: Increased if `CURRENT_NUMBER_OF_BYTES_USED` is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_FREE`: Increased by 1
- `CURRENT_COUNT_USED`: Decreased by 1
- `LOW_COUNT_USED`: Decreased if `CURRENT_COUNT_USED` is a new minimum
- `SUM_NUMBER_OF_BYTES_FREE`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by *N*
- `LOW_NUMBER_OF_BYTES_USED`: Decreased if `CURRENT_NUMBER_OF_BYTES_USED` is a new minimum

For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- `LOW_COUNT_USED` and `LOW_NUMBER_OF_BYTES_USED` are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.
- `HIGH_COUNT_USED` and `HIGH_NUMBER_OF_BYTES_USED` are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than `memory_summary_global_by_event_name`, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` columns of the `memory_summary_by_thread_by_event_name` table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That

is, the LOW_NUMBER_OF_BYTES_USED for the higher level aggregate is the sum of each LOW_NUMBER_OF_BYTES_USED (assuming the worst case). Likewise, the HIGH_NUMBER_OF_BYTES_USED for the higher level aggregate is the sum of each HIGH_NUMBER_OF_BYTES_USED (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

25.11.15.11 Error Summary Tables

The Performance Schema maintains summary tables for aggregating statistical information about server errors (and warnings). For a list of server errors, see Section B.3, “Server Error Codes and Messages”.

Collection of error information is controlled by the error instrument, which is enabled by default. Timing information is not collected.

Each error summary table has three columns that identify the error:

- ERROR_NUMBER is the numeric error value. The value is unique.
- ERROR_NAME is the symbolic error name corresponding to the ERROR_NUMBER value. The value is unique.
- SQLSTATE is the SQLSTATE value corresponding to the ERROR_NUMBER value. The value is not necessarily unique.

For example, if ERROR_NUMBER is 1050, ERROR_NAME is ER_TABLE_EXISTS_ERROR and SQLSTATE is 42S01.

Example error event summary information:

```
mysql> SELECT * FROM events_errors_summary_global_by_error
       WHERE SUM_ERROR_RAISED <> 0\G
*************************** 1. row ***************************
     ERROR_NUMBER: 1064
       ERROR_NAME: ER_PARSE_ERROR
        SQL_STATE: 42000
 SUM_ERROR_RAISED: 1
SUM_ERROR_HANDLED: 0
       FIRST_SEEN: 2016-06-28 07:34:02
        LAST_SEEN: 2016-06-28 07:34:02
*************************** 2. row ***************************
     ERROR_NUMBER: 1146
       ERROR_NAME: ER_NO_SUCH_TABLE
        SQL_STATE: 42S02
 SUM_ERROR_RAISED: 2
SUM_ERROR_HANDLED: 0
       FIRST_SEEN: 2016-06-28 07:34:05
        LAST_SEEN: 2016-06-28 07:36:18
*************************** 3. row ***************************
     ERROR_NUMBER: 1317
       ERROR_NAME: ER_QUERY_INTERRUPTED
        SQL_STATE: 70100
 SUM_ERROR_RAISED: 1
SUM_ERROR_HANDLED: 0
       FIRST_SEEN: 2016-06-28 11:01:49
        LAST_SEEN: 2016-06-28 11:01:49
```

Each error summary table has one or more grouping columns to indicate how the table aggregates errors:

- `events_errors_summary_by_account_by_error` has `USER`, `HOST`, and `ERROR_NUMBER` columns. Each row summarizes events for a given account (user and host combination) and error.
- `events_errors_summary_by_host_by_error` has `HOST` and `ERROR_NUMBER` columns. Each row summarizes events for a given host and error.
- `events_errors_summary_by_thread_by_error` has `THREAD_ID` and `ERROR_NUMBER` columns. Each row summarizes events for a given thread and error.
- `events_errors_summary_by_user_by_error` has `USER` and `ERROR_NUMBER` columns. Each row summarizes events for a given user and error.
- `events_errors_summary_global_by_error` has an `ERROR_NUMBER` column. Each row summarizes events for a given error.

Each error summary table has these summary columns containing aggregated values:

- `SUM_ERROR_RAISED`

  This column aggregates the number of times the error occurred.

- `SUM_ERROR_HANDLED`

  This column aggregates the number of times the error was handled by an SQL exception handler.

- `FIRST_SEEN`, `LAST_SEEN`

  Timestamp indicating when the error was first seen and most recently seen.

A `NULL` row in each error summary table is used to aggregate statistics for all errors that lie out of range of the instrumented errors. For example, if MySQL Server errors lie in the range from *`M`* to *`N`* and an error is raised with number *`Q`* not in that range, the error is aggregated in the `NULL` row. The `NULL` row is the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

The error summary tables have these indexes:

- `events_errors_summary_by_account_by_error`:
  - Primary key on (`USER`, `HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_host_by_error`:
  - Primary key on (`HOST`, `ERROR_NUMBER`)
- `events_errors_summary_by_thread_by_error`:
  - Primary key on (`THREAD_ID`, `ERROR_NUMBER`)
- `events_errors_summary_by_user_by_error`:
  - Primary key on (`USER`, `ERROR_NUMBER`)
- `events_errors_summary_global_by_error`:
  - Primary key on (`ERROR_NUMBER`)

`TRUNCATE TABLE` is permitted for error summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero or `NULL` rather than removing rows.

- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero or `NULL` for the remaining rows.

In addition, each error summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_errors_summary_global_by_error`. For details, see Section 25.11.8, “Performance Schema Connection Tables”.

25.11.15.12 Status Variable Summary Tables

The Performance Schema makes status variable information available in the tables described in Section 25.11.14, “Performance Schema Status Variable Tables”. It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- `status_by_account` has `USER`, `HOST`, and `VARIABLE_NAME` columns to summarize status variables by account.
- `status_by_host` has `HOST` and `VARIABLE_NAME` columns to summarize status variables by the host from which clients connected.
- `status_by_user` has `USER` and `VARIABLE_NAME` columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- `VARIABLE_VALUE`

  The aggregated status variable value for active and terminated sessions.

The status variable summary tables have these indexes:

- `status_by_account`:
  - Primary key on (`USER`, `HOST`, `VARIABLE_NAME`)
- `status_by_host`:
  - Primary key on (`HOST`, `VARIABLE_NAME`)
- `status_by_user`:
  - Primary key on (`USER`, `VARIABLE_NAME`)

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- `status_by_account`: Aggregates account status from terminated sessions to user and host status, then resets account status.

- `status_by_host`: Resets aggregated host status from terminated sessions.
- `status_by_user`: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

25.11.16 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- `host_cache`: Information from the internal host cache
- `performance_timers`: Which event timers are available
- `threads`: Information about server threads

25.11.16.1 The host_cache Table

The `host_cache` table provides access to the contents of the host cache, which contains client host name and IP address information and is used to avoid DNS lookups. (See Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”.) The `host_cache` table exposes the contents of the host cache so that it can be examined using `SELECT` statements. The Performance Schema must be enabled or this table is empty.

The `host_cache` table has these columns:

- `IP`

  The IP address of the client that connected to the server, expressed as a string.

- `HOST`

  The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- `HOST_VALIDATED`

  Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted again for each connect, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would affect clients forever.

- `SUM_CONNECT_ERRORS`

  The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (`HOST_VALIDATED = YES`).

- `COUNT_HOST_BLOCKED_ERRORS`

  The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- `COUNT_NAMEINFO_TRANSIENT_ERRORS`

  The number of transient errors during IP-to-host name DNS resolution.

- `COUNT_NAMEINFO_PERMANENT_ERRORS`

The number of permanent errors during IP-to-host name DNS resolution.

- `COUNT_FORMAT_ERRORS`

  The number of host name format errors. MySQL does not perform matching of `Host` column values in the `mysql.user` table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see Section 6.2.4, “Specifying Account Names”.

- `COUNT_ADDRINFO_TRANSIENT_ERRORS`

  The number of transient errors during host name-to-IP reverse DNS resolution.

- `COUNT_ADDRINFO_PERMANENT_ERRORS`

  The number of permanent errors during host name-to-IP reverse DNS resolution.

- `COUNT_FCRDNS_ERRORS`

  The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

- `COUNT_HOST_ACL_ERRORS`

  The number of errors that occur because no user from the client host can possibly log in. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

- `COUNT_NO_AUTH_PLUGIN_ERRORS`

  The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

- `COUNT_AUTH_PLUGIN_ERRORS`

  The number of errors reported by authentication plugins.

  An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is incremented: `COUNT_AUTHENTICATION_ERRORS`, `COUNT_AUTH_PLUGIN_ERRORS`, `COUNT_HANDSHAKE_ERRORS`. New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the `COUNT_AUTH_PLUGIN_ERRORS` column.

- `COUNT_HANDSHAKE_ERRORS`

  The number of errors detected at the wire protocol level.

- `COUNT_PROXY_USER_ERRORS`

  The number of errors detected when a proxy user A is proxied to another user B who does not exist.

- `COUNT_PROXY_USER_ACL_ERRORS`

  The number of errors detected when a proxy user A is proxied to another user B who does exist but for whom A does not have the `PROXY` privilege.

- `COUNT_AUTHENTICATION_ERRORS`

  The number of errors caused by failed authentication.

- `COUNT_SSL_ERRORS`

The number of errors due to SSL problems.

- `COUNT_MAX_USER_CONNECTIONS_ERRORS`

  The number of errors caused by exceeding per-user connection quotas. See Section 6.3.6, “Setting Account Resource Limits”.

- `COUNT_MAX_USER_CONNECTIONS_PER_HOUR_ERRORS`

  The number of errors caused by exceeding per-user connections-per-hour quotas. See Section 6.3.6, “Setting Account Resource Limits”.

- `COUNT_DEFAULT_DATABASE_ERRORS`

  The number of errors related to the default database. For example, the database did not exist or the user had no privileges for accessing it.

- `COUNT_INIT_CONNECT_ERRORS`

  The number of errors caused by execution failures of statements in the `init_connect` system variable value.

- `COUNT_LOCAL_ERRORS`

  The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- `COUNT_UNKNOWN_ERRORS`

  The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and table structure of the `host_cache` table is required.

- `FIRST_SEEN`

  The timestamp of the first connection attempt seen from the client in the `IP` column.

- `LAST_SEEN`

  The timestamp of the last connection attempt seen from the client in the `IP` column.

- `FIRST_ERROR_SEEN`

  The timestamp of the first error seen from the client in the `IP` column.

- `LAST_ERROR_SEEN`

  The timestamp of the last error seen from the client in the `IP` column.

The `host_cache` table has these indexes:

- Primary key on (`IP`)
- Index on (`HOST`)

`FLUSH HOSTS` and `TRUNCATE TABLE host_cache` have the same effect: They clear the host cache. This also removes rows from the `host_cache` table (because it is the visible representation of the cache) and unblocks any blocked hosts (see Section B.5.2.5, “Host 'host_name' is blocked”.) `FLUSH HOSTS` requires the `RELOAD` privilege. `TRUNCATE TABLE` requires the `DROP` privilege for the `host_cache` table.

25.11.16.2 The performance_timers Table

The `performance_timers` table shows which event timers are available:

```
mysql> SELECT * FROM performance_timers;
+-------------+-----------------+------------------+----------------+
| TIMER_NAME  | TIMER_FREQUENCY | TIMER_RESOLUTION | TIMER_OVERHEAD |
+-------------+-----------------+------------------+----------------+
| CYCLE       |      2389029850 |                1 |             72 |
| NANOSECOND  |      1000000000 |                1 |            112 |
| MICROSECOND |         1000000 |                1 |            136 |
| MILLISECOND |            1036 |                1 |            168 |
| TICK        |             105 |                1 |           2416 |
+-------------+-----------------+------------------+----------------+
```

The timers in `setup_timers` that you can use are those that do not have `NULL` in the other columns. If the values associated with a given timer name are `NULL`, that timer is not supported on your platform.

The `performance_timers` table has these columns:

- `TIMER_NAME`

  The name by which to refer to the timer when configuring the `setup_timers` table.

- `TIMER_FREQUENCY`

  The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.

- `TIMER_RESOLUTION`

  Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- `TIMER_OVERHEAD`

  The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

The `performance_timers` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `performance_timers` table.

25.11.16.3 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```
mysql> SELECT * FROM threads\G
*************************** 1. row ***************************
          THREAD_ID: 1
               NAME: thread/sql/main
               TYPE: BACKGROUND
     PROCESSLIST_ID: NULL
   PROCESSLIST_USER: NULL
   PROCESSLIST_HOST: NULL
     PROCESSLIST_DB: NULL
PROCESSLIST_COMMAND: NULL
```

```
   PROCESSLIST_TIME: 80284
  PROCESSLIST_STATE: NULL
   PROCESSLIST_INFO: NULL
   PARENT_THREAD_ID: NULL
               ROLE: NULL
       INSTRUMENTED: YES
            HISTORY: YES
    CONNECTION_TYPE: NULL
       THREAD_OS_ID: 489803

...
*************************** 4. row ***************************
         THREAD_ID: 51
              NAME: thread/sql/one_connection
              TYPE: FOREGROUND
     PROCESSLIST_ID: 34
   PROCESSLIST_USER: isabella
   PROCESSLIST_HOST: localhost
     PROCESSLIST_DB: performance_schema
PROCESSLIST_COMMAND: Query
   PROCESSLIST_TIME: 0
  PROCESSLIST_STATE: Sending data
   PROCESSLIST_INFO: SELECT * FROM threads
   PARENT_THREAD_ID: 1
               ROLE: NULL
       INSTRUMENTED: YES
            HISTORY: YES
    CONNECTION_TYPE: SSL/TLS
       THREAD_OS_ID: 755399

...
```

When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see Section 25.4.6, “Pre-Filtering by Thread”.

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

The `threads` table columns with names having a prefix of `PROCESSLIST_` provide information similar to that available from the `INFORMATION_SCHEMA.PROCESSLIST` table or the `SHOW PROCESSLIST` statement. Thus, all three sources provide thread-monitoring information. Use of `threads` differs from use of the other two sources in these ways:

- Access to `threads` does not require a mutex and has minimal impact on server performance. `INFORMATION_SCHEMA.PROCESSLIST` and `SHOW PROCESSLIST` have negative performance consequences because they require a mutex.
- `threads` provides additional information for each thread, such as whether it is a foreground or background thread, and the location within the server associated with the thread.
- `threads` provides information about background threads, so it can be used to monitor activity the other thread information sources cannot.
- You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more

information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the `INSTRUMENTED` and `HISTORY` columns.)

For these reasons, DBAs who perform server monitoring using `INFORMATION_SCHEMA.PROCESSLIST` or `SHOW PROCESSLIST` may wish to monitor using the `threads` table instead.

Note

For `INFORMATION_SCHEMA.PROCESSLIST` and `SHOW PROCESSLIST`, information about threads for other users is shown only if the current user has the `PROCESS` privilege. That is not true of the `threads` table; all rows are shown to any user who has the `SELECT` privilege for the table. Users who should not be able to see threads for other users should not be given that privilege.

The `threads` table has these columns:

- `THREAD_ID`

  A unique thread identifier.

- `NAME`

  The name associated with the thread instrumentation code in the server. For example, `thread/sql/one_connection` corresponds to the thread function in the code responsible for handling a user connection, and `thread/sql/main` stands for the `main()` function of the server.

- `TYPE`

  The thread type, either `FOREGROUND` or `BACKGROUND`. User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are internal `InnoDB` threads, “binlog dump” threads sending information to slaves, and slave I/O and SQL threads.

- `PROCESSLIST_ID`

  For threads that are displayed in the `INFORMATION_SCHEMA.PROCESSLIST` table, this is the same value displayed in the `ID` column of that table. It is also the value displayed in the `Id` column of `SHOW PROCESSLIST` output, and the value that `CONNECTION_ID()` would return within that thread.

  For background threads (threads not associated with a user connection), `PROCESSLIST_ID` is `NULL`, so the values are not unique.

- `PROCESSLIST_USER`

  The user associated with a foreground thread, `NULL` for a background thread.

- `PROCESSLIST_HOST`

  The host name of the client associated with a foreground thread, `NULL` for a background thread.

  Unlike the `HOST` column of the `INFORMATION_SCHEMA PROCESSLIST` table or the `Host` column of `SHOW PROCESSLIST` output, the `PROCESSLIST_HOST` column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the `socket_instances` table:

```
mysql> SELECT NAME, ENABLED, TIMED FROM setup_instruments
       WHERE NAME LIKE 'wait/io/socket%';
+----------------------------------------+---------+-------+
| NAME                                   | ENABLED | TIMED |
+----------------------------------------+---------+-------+
```

```
| wait/io/socket/sql/server_tcpip_socket | NO      | NO    |
| wait/io/socket/sql/server_unix_socket  | NO      | NO    |
| wait/io/socket/sql/client_connection   | NO      | NO    |
+----------------------------------------+---------+-------+
3 rows in set (0.01 sec)

mysql> UPDATE setup_instruments SET ENABLED='YES' WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3  Changed: 3  Warnings: 0

mysql> SELECT * FROM socket_instances\G
*************************** 1. row ***************************
          EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
            THREAD_ID: 31
            SOCKET_ID: 53
                   IP: ::ffff:127.0.0.1
                 PORT: 55642
                STATE: ACTIVE
...
```

- `PROCESSLIST_DB`

  The default database for the thread, or `NULL` if there is none.

- `PROCESSLIST_COMMAND`

  For foreground threads, the type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle. For descriptions of thread commands, see Section 8.14, “Examining Thread Information”. The value of this column corresponds to the `COM_xxx` commands of the client/server protocol and `Com_xxx` status variables. See Section 5.1.7, “Server Status Variables”

  Background threads do not execute commands on behalf of clients, so this column may be `NULL`.

- `PROCESSLIST_TIME`

  The time in seconds that the thread has been in its current state.

- `PROCESSLIST_STATE`

  An action, event, or state that indicates what the thread is doing. For descriptions of `PROCESSLIST_STATE` values, see Section 8.14, “Examining Thread Information”. If the value if `NULL`, the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

  Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- `PROCESSLIST_INFO`

  The statement the thread is executing, or `NULL` if it is not executing any statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a `CALL` statement executes a stored procedure that is executing a `SELECT` statement, the `PROCESSLIST_INFO` value shows the `SELECT` statement.

- `PARENT_THREAD_ID`

  If this thread is a subthread (spawned by another thread), this is the `THREAD_ID` value of the spawning thread.

- `ROLE`

  Unused.

- `INSTRUMENTED`

Whether events executed by the thread are instrumented. The value is `YES` or `NO`.

- For foreground threads, the initial `INSTRUMENTED` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

  If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `INSTRUMENTED` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.

- For any thread, its `INSTRUMENTED` value can be changed during the lifetime of the thread.

For monitoring of events executed by the thread to occur, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.

- The `threads.INSTRUMENTED` column must be `YES`.

- Monitoring occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `HISTORY`

  Whether to log historical events for the thread. The value is `YES` or `NO`.

  - For foreground threads, the initial `HISTORY` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

    If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

  - For background threads, `HISTORY` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.

  - For any thread, its `HISTORY` value can be changed during the lifetime of the thread.

  For historical event logging for the thread to occur, these things must be true:

  - The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.

  - The `threads.HISTORY` column must be `YES`.

  - Logging occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

- `CONNECTION_TYPE`

  The protocol used to establish the connection, or `NULL` for background threads. Permitted values are `TCP/IP` (TCP/IP connection established without SSL), `SSL/TLS` (TCP/IP connection established with SSL), `Socket` (Unix socket file connection), `Named Pipe` (Windows named pipe connection), and `Shared Memory` (Windows shared memory connection).

- `THREAD_OS_ID`

  The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.
- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see MySQL Enterprise Thread Pool).

For Windows, `THREAD_OS_ID` corresponds to the thread ID visible in Process Explorer (https://technet.microsoft.com/en-us/sysinternals/bb896653.aspx).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1)`, `ps(1)`, and `proc(5)` man pages.

The `threads` table has these indexes:

- Primary key on (`THREAD_ID`)
- Index on (`NAME`)
- Index on (`PROCESSLIST_ID`)
- Index on (`PROCESSLIST_USER`, `PROCESSLIST_HOST`)
- Index on (`PROCESSLIST_HOST`)
- Index on (`THREAD_OS_ID`)

`TRUNCATE TABLE` is not permitted for the `threads` table.

25.11.16.4 The user_defined_functions Table

The `user_defined_functions` table contains a row for each user-defined function (UDF) registered by a server component or plugin, or by a `CREATE FUNCTION` statement.

`user_defined_functions` has these columns:

- `UDF_NAME`

  The UDF name. The value is `NULL` if the function was registered by a `CREATE FUNCTION` statement and is in the process of unloading.

- `UDF_RETURN_TYPE`

  The UDF return value type. The value is one of `int`, `decimal`, `real`, `char`, or `row`.

- `UDF_TYPE`

  The UDF type. The value is one of `function` (scalar) or `aggregate`.

- `UDF_LIBRARY`

  The UDF library file. The value is `NULL` if the UDF was registered using a server component service rather than by a `CREATE FUNCTION` statement.

- `UDF_USAGE_COUNT`

  The current UDF usage count.

The `user_defined_functions` table has these indexes:

- Primary key on (`UDF_NAME`)

`TRUNCATE TABLE` is not permitted for the `user_defined_functions` table.

25.12 Performance Schema Option and Variable Reference

Table 25.3 Performance Schema Variable Reference

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dynamic
performance_schema	Yes	Yes	Yes		Global	No

25.13 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see Section 25.4, “Performance Schema Runtime Configuration”), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see Section 25.3, “Performance Schema Startup Configuration”.

- `--performance-schema-consumer-`*`consumer_name`*`=value`

  Configure a Performance Schema consumer. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=`*`instrument_name`*`=value`

  Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`

  Configure the `events-stages-current` consumer.

- `--performance-schema-consumer-events-stages-history=value`

  Configure the `events-stages-history` consumer.

- `--performance-schema-consumer-events-stages-history-long=value`

  Configure the `events-stages-history-long` consumer.

- `--performance-schema-consumer-events-statements-current=value`

  Configure the `events-statements-current` consumer.

- `--performance-schema-consumer-events-statements-history=value`

Configure the `events-statements-history` consumer.

- `--performance-schema-consumer-events-statements-history-long=value`

  Configure the `events-statements-history-long` consumer.

- `--performance-schema-consumer-events-transactions-current=value`

  Configure the Performance Schema `events-transactions-current` consumer.

- `--performance-schema-consumer-events-transactions-history=value`

  Configure the Performance Schema `events-transactions-history` consumer.

- `--performance-schema-consumer-events-transactions-history-long=value`

  Configure the Performance Schema `events-transactions-history-long` consumer.

- `--performance-schema-consumer-events-waits-current=value`

  Configure the `events-waits-current` consumer.

- `--performance-schema-consumer-events-waits-history=value`

  Configure the `events-waits-history` consumer.

- `--performance-schema-consumer-events-waits-history-long=value`

  Configure the `events-waits-history-long` consumer.

- `--performance-schema-consumer-global-instrumentation=value`

  Configure the `global-instrumentation` consumer.

- `--performance-schema-consumer-statements-digest=value`

  Configure the `statements-digest` consumer.

- `--performance-schema-consumer-thread-instrumentation=value`

  Configure the `thread-instrumentation` consumer.

25.14 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
+-----------------------------------------------------------+-------+
| Variable_name                                             | Value |
+-----------------------------------------------------------+-------+
| performance_schema                                        | ON    |
| performance_schema_accounts_size                          | -1    |
| performance_schema_digests_size                           | 10000 |
| performance_schema_events_stages_history_long_size        | 10000 |
| performance_schema_events_stages_history_size             | 10    |
| performance_schema_events_statements_history_long_size    | 10000 |
| performance_schema_events_statements_history_size         | 10    |
| performance_schema_events_transactions_history_long_size | 10000 |
| performance_schema_events_transactions_history_size       | 10    |
| performance_schema_events_waits_history_long_size         | 10000 |
| performance_schema_events_waits_history_size              | 10    |
| performance_schema_hosts_size                             | -1    |
| performance_schema_max_cond_classes                       | 80    |
| performance_schema_max_cond_instances                     | -1    |
| performance_schema_max_digest_length                      | 1024  |
```

```
| performance_schema_max_file_classes                     | 50    |
| performance_schema_max_file_handles                     | 32768 |
| performance_schema_max_file_instances                   | -1    |
| performance_schema_max_index_stat                       | -1    |
| performance_schema_max_memory_classes                   | 320   |
| performance_schema_max_metadata_locks                   | -1    |
| performance_schema_max_mutex_classes                    | 220   |
| performance_schema_max_mutex_instances                  | -1    |
| performance_schema_max_prepared_statements_instances    | -1    |
| performance_schema_max_program_instances                | -1    |
| performance_schema_max_rwlock_classes                   | 40    |
| performance_schema_max_rwlock_instances                 | -1    |
| performance_schema_max_socket_classes                   | 10    |
| performance_schema_max_socket_instances                 | -1    |
| performance_schema_max_sql_text_length                  | 1024  |
| performance_schema_max_stage_classes                    | 150   |
| performance_schema_max_statement_classes                | 192   |
| performance_schema_max_statement_stack                  | 10    |
| performance_schema_max_table_handles                    | -1    |
| performance_schema_max_table_instances                  | -1    |
| performance_schema_max_table_lock_stat                  | -1    |
| performance_schema_max_thread_classes                   | 50    |
| performance_schema_max_thread_instances                 | -1    |
| performance_schema_session_connect_attrs_size           | 512   |
| performance_schema_setup_actors_size                    | -1    |
| performance_schema_setup_objects_size                   | -1    |
| performance_schema_users_size                           | -1    |
+---------------------------------------------------------+-------+
```

Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See Section 25.12, “Performance Schema Option and Variable Reference”.

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see Section 25.3, “Performance Schema Startup Configuration”.

Performance Schema system variables have the following meanings:

- `performance_schema`

Command-Line Format	`--performance-schema=#`	
System Variable	**Name**	`performance_schema`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	boolean
	Default	`ON`

  The value of this variable is `ON` or `OFF` to indicate whether the Performance Schema is enabled. By default, the value is `ON`. At server startup, you can specify this variable with no value or a value of `ON` or 1 to enable it, or with a value of `OFF` or 0 to disable it.

  Even when the Performance Schema is disabled, it continues to populate the `global_variables`, `session_variables`, `global_status`, and `session_status` tables. This occurs as necessary to permit the results for the `SHOW VARIABLES` and `SHOW STATUS` statements to be drawn from those tables, depending on the setting of the `show_compatibility_56` system variable. The Performance Schema also populates some of the replication tables when disabled.

- `performance_schema_accounts_size`

Command-Line Format	`--performance-schema-accounts-size=#`

System Variable	Name	performance_schema_accounts_size
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autoscaled)
	Min Value	-1 (autoscaled)
	Max Value	1048576

The number of rows in the accounts table. If this variable is 0, the Performance Schema does not maintain connection statistics in the accounts table or status variable information in the status_by_account table.

- performance_schema_digests_size

Command-Line Format	--performance-schema-digests-size=#	
System Variable	Name	performance_schema_digests_size
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autosized)
	Min Value	-1
	Max Value	1048576

The maximum number of rows in the events_statements_summary_by_digest table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the Performance_schema_digest_lost status variable.

For more information about statement digesting, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

- performance_schema_error_size

Command-Line Format	--performance-schema-error-size	
System Variable	Name	performance_schema_error_size
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	number of server error codes
	Min Value	0

	Max Value	1048576

The number of instrumented server error codes. The default value is the actual number of server error codes. Although the value can be set anywhere from 0 to its maximum, the intended use is to set it to either its default (to instrument all errors) or 0 (to instrument no errors).

Error information is aggregated in summary tables; see Section 25.11.15.11, “Error Summary Tables”. If an error occurs that is not instrumented, information for the occurrence is aggregated to the `NULL` row in each summary table; that is, to the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

- `performance_schema_events_stages_history_long_size`

Command-Line Format	`--performance-schema-events-stages-history-long-size=#`	
System Variable	**Name**	`performance_schema_events_stages_history_long_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The number of rows in the `events_stages_history_long` table.

- `performance_schema_events_stages_history_size`

Command-Line Format	`--performance-schema-events-stages-history-size=#`	
System Variable	**Name**	`performance_schema_events_stages_history_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The number of rows per thread in the `events_stages_history` table.

- `performance_schema_events_statements_history_long_size`

Command-Line Format	`--performance-schema-events-statements-history-long-size=#`	
System Variable	**Name**	`performance_schema_events_statements_history_long_siz`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The number of rows in the `events_statements_history_long` table.

- `performance_schema_events_statements_history_size`

Command-Line Format	`--performance-schema-events-statements-history-size=#`	
System Variable	Name	`performance_schema_events_statements_history_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autosized)`

The number of rows per thread in the `events_statements_history` table.

- `performance_schema_events_transactions_history_long_size`

Command-Line Format	`--performance-schema-events-transactions-history-long-size=#`	
System Variable	Name	`performance_schema_events_transactions_history_long_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autosized)`

The number of rows in the `events_transactions_history_long` table.

- `performance_schema_events_transactions_history_size`

Command-Line Format	`--performance-schema-events-transactions-history-size=#`	
System Variable	Name	`performance_schema_events_transactions_history_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autosized)`

The number of rows per thread in the `events_transactions_history` table.

- `performance_schema_events_waits_history_long_size`

Command-Line Format	`--performance-schema-events-waits-history-long-size=#`	
System Variable	Name	`performance_schema_events_waits_history_long_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autosized)`

The number of rows in the `events_waits_history_long` table.

- `performance_schema_events_waits_history_size`

Command-Line Format	`--performance-schema-events-waits-history-size=#`	
System Variable	Name	`performance_schema_events_waits_history_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autosized)`

The number of rows per thread in the `events_waits_history` table.

- `performance_schema_hosts_size`

Command-Line Format	`--performance-schema-hosts-size=#`	
System Variable	Name	`performance_schema_hosts_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`
	Min Value	`-1 (autoscaled)`
	Max Value	`1048576`

The number of rows in the `hosts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `hosts` table or status variable information in the `status_by_host` table.

- `performance_schema_max_cond_classes`

Command-Line Format	`--performance-schema-max-cond-classes=#`	
System Variable	Name	`performance_schema_max_cond_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`80`

The maximum number of condition instruments.

- `performance_schema_max_cond_instances`

Command-Line Format	`--performance-schema-max-cond-instances=#`	
System Variable	Name	`performance_schema_max_cond_instances`

	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autoscaled)`

The maximum number of instrumented condition objects.

- `performance_schema_max_digest_length`

Command-Line Format	`--performance-schema-max-digest-length=#`	
System Variable	**Name**	`performance_schema_max_digest_length`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`1024`
	Min Value	`0`
	Max Value	`1048576`

The maximum number of bytes available for storage of normalized statement digest values in the Performance Schema. This variable is related to `max_digest_length`; see the description of that variable in Section 5.1.5, “Server System Variables”

For more information about statement digesting, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

- `performance_schema_max_digest_sample_age`

Introduced	8.0.3	
Command-Line Format	`--performance-schema-max-digest-sample-age=#`	
System Variable	**Name**	`performance_schema_max_digest_sample_age`
	Variable Scope	Global
	Dynamic Variable	Yes
Permitted Values	**Type**	integer
	Default	`60`
	Min Value	`0`
	Max Value	`1048576`

This variable affects statement sampling for the `events_statements_summary_by_digest` table. When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace

the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.
- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

For information about statement sampling, see Section 25.9, “Performance Schema Statement Digests and Sampling”.

- `performance_schema_max_file_classes`

Command-Line Format	`--performance-schema-max-file-classes=#`	
System Variable	**Name**	`performance_schema_max_file_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`80`

The maximum number of file instruments.

- `performance_schema_max_file_handles`

Command-Line Format	`--performance-schema-max-file-handles=#`	
System Variable	**Name**	`performance_schema_max_file_handles`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`32768`

The maximum number of opened file objects.

The value of `performance_schema_max_file_handles` should be greater than the value of `open_files_limit`: `open_files_limit` affects the maximum number of open file handles the server can support and `performance_schema_max_file_handles` affects how many of these file handles can be instrumented.

- `performance_schema_max_file_instances`

Command-Line Format	`--performance-schema-max-file-instances=#`	
System Variable	**Name**	`performance_schema_max_file_instances`
	Variable Scope	Global
	Dynamic Variable	No

Permitted Values	**Type**	integer
	Default	`-1 (autoscaled)`

The maximum number of instrumented file objects.

- `performance_schema_max_index_stat`

Command-Line Format	`--performance-schema-max-index-stat=#`	
System Variable	**Name**	`performance_schema_max_index_stat`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the `Performance_schema_index_stat_lost` status variable. The default value is autosized using the value of `performance_schema_max_table_instances`.

- `performance_schema_max_memory_classes`

Command-Line Format	`--performance-schema-max-memory-classes=#`	
System Variable	**Name**	`performance_schema_max_memory_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values (8.0.0)	**Type**	integer
	Default	`350`
Permitted Values (>= 8.0.1)	**Type**	integer
	Default	`450`

The maximum number of memory instruments.

- `performance_schema_max_metadata_locks`

Command-Line Format	`--performance-schema-max-metadata-locks=#`	
System Variable	**Name**	`performance_schema_max_metadata_locks`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autoscaled)`

The maximum number of metadata lock instruments. This value controls the size of the `metadata_locks` table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the `Performance_schema_metadata_lock_lost` status variable.

- `performance_schema_max_mutex_classes`

Command-Line Format	`--performance-schema-max-mutex-classes=#`	
System Variable	Name	`performance_schema_max_mutex_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values (8.0.0)	Type	integer
	Default	`200`
Permitted Values (>= 8.0.1, <= 8.0.2)	Type	integer
	Default	`220`
Permitted Values (>= 8.0.3)	Type	integer
	Default	`250`

The maximum number of mutex instruments.

- `performance_schema_max_mutex_instances`

Command-Line Format	`--performance-schema-max-mutex-instances=#`	
System Variable	Name	`performance_schema_max_mutex_instances`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`

The maximum number of instrumented mutex objects.

- `performance_schema_max_prepared_statements_instances`

Command-Line Format	`--performance-schema-max-prepared-statements-instances=#`	
System Variable	Name	`performance_schema_max_prepared_statements_instances`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `Performance_schema_prepared_statements_lost` status variable. The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- `performance_schema_max_rwlock_classes`

Command-Line Format	`--performance-schema-max-rwlock-classes=#`

System Variable	Name	performance_schema_max_rwlock_classes
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	40

The maximum number of rwlock instruments.

- performance_schema_max_program_instances

Command-Line Format	--performance-schema-max-program-instances=#	
System Variable	Name	performance_schema_max_program_instances
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autoscaled)

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the Performance_schema_program_lost status variable.

- performance_schema_max_rwlock_instances

Command-Line Format	--performance-schema-max-rwlock-instances=#	
System Variable	Name	performance_schema_max_rwlock_instances
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autoscaled)

The maximum number of instrumented rwlock objects.

- performance_schema_max_socket_classes

Command-Line Format	--performance-schema-max-socket-classes=#	
System Variable	Name	performance_schema_max_socket_classes
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	10

The maximum number of socket instruments.

- performance_schema_max_socket_instances

Command-Line Format	--performance-schema-max-socket-instances=#	
System Variable	Name	performance_schema_max_socket_instances
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autoscaled)

The maximum number of instrumented socket objects.

- performance_schema_max_sql_text_length

Command-Line Format	--performance-schema-max-sql-text-length=#	
System Variable	Name	performance_schema_max_sql_text_length
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	1024
	Min Value	0
	Max Value	1048576

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The SQL_TEXT column of the events_statements_current, events_statements_history, and events_statements_history_long statement event tables.
- The QUERY_SAMPLE_TEXT column of the events_statements_summary_by_digest summary table.

Any bytes in excess of performance_schema_max_sql_text_length are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the performance_schema_max_sql_text_length value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- performance_schema_max_stage_classes

Command-Line Format	--performance-schema-max-stage-classes=#	
System Variable	Name	performance_schema_max_stage_classes
	Variable Scope	Global
	Dynamic Variable	No

Permitted Values	**Type**	integer
	Default	`150`

The maximum number of stage instruments.

- `performance_schema_max_statement_classes`

Command-Line Format	`--performance-schema-max-statement-classes=#`	
System Variable	**Name**	`performance_schema_max_statement_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The maximum number of statement instruments. The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated then is needed.

- `performance_schema_max_statement_stack`

Command-Line Format	`--performance-schema-max-statement-stack=#`	
System Variable	**Name**	`performance_schema_max_statement_stack`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`10`

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the `Performance_schema_nested_statement_lost` status variable for each stored program statement executed.

- `performance_schema_max_table_handles`

Command-Line Format	`--performance-schema-max-table-handles=#`	
System Variable	**Name**	`performance_schema_max_table_handles`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autoscaled)`

The maximum number of opened table objects. This value controls the size of the `table_handles` table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the `Performance_schema_table_handles_lost` status variable.

- `performance_schema_max_table_instances`

Command-Line Format	`--performance-schema-max-table-instances=#`	
System Variable	**Name**	`performance_schema_max_table_instances`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autoscaled)`

The maximum number of instrumented table objects.

- `performance_schema_max_table_lock_stat`

Command-Line Format	`--performance-schema-max-table-lock-stat=#`	
System Variable	**Name**	`performance_schema_max_table_lock_stat`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	**Type**	integer
	Default	`-1 (autosized)`

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `Performance_schema_table_lock_stat_lost` status variable.

- `performance_schema_max_thread_classes`

Command-Line Format	`--performance-schema-max-thread-classes=#`	
System Variable	**Name**	`performance_schema_max_thread_classes`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values (<= 8.0.2)	**Type**	integer
	Default	`50`
Permitted Values (>= 8.0.3)	**Type**	integer
	Default	`100`

The maximum number of thread instruments.

- `performance_schema_max_thread_instances`

Command-Line Format	`--performance-schema-max-thread-instances=#`

System Variable	Name	performance_schema_max_thread_instances
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autoscaled)

The maximum number of instrumented thread objects. The value controls the size of the `threads` table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the `Performance_schema_thread_instances_lost` status variable.

The `max_connections` system variable affects how many threads can run in the server. `performance_schema_max_thread_instances` affects how many of these running threads can be instrumented.

The `variables_by_thread` and `status_by_thread` tables contain system and status variable information information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

- `performance_schema_session_connect_attrs_size`

Command-Line Format	--performance-schema-session-connect-attrs-size=#	
System Variable	Name	performance_schema_session_connect_attrs_size
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	-1 (autosized)
	Min Value	-1
	Max Value	1048576

The amount of preallocated memory per thread reserved to hold connection attribute key/value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the `Performance_schema_session_connect_attrs_lost` status variable, and writes a message to the error log indicating that truncation occurred if the `log_error_verbosity` system variable is greater than 1. A `_truncated` attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`Performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute

data, the server rejects the connection. For more information, see Section 25.11.9, “Performance Schema Connection Attribute Tables”.

- `performance_schema_setup_actors_size`

Command-Line Format	`--performance-schema-setup-actors-size=#`	
System Variable	Name	`performance_schema_setup_actors_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`

The number of rows in the `setup_actors` table.

- `performance_schema_setup_objects_size`

Command-Line Format	`--performance-schema-setup-objects-size=#`	
System Variable	Name	`performance_schema_setup_objects_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`

The number of rows in the `setup_objects` table.

- `performance_schema_users_size`

Command-Line Format	`--performance-schema-users-size=#`	
System Variable	Name	`performance_schema_users_size`
	Variable Scope	Global
	Dynamic Variable	No
Permitted Values	Type	integer
	Default	`-1 (autoscaled)`
	Min Value	`-1 (autoscaled)`
	Max Value	`1048576`

The number of rows in the `users` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `users` table or status variable information in the `status_by_user` table.

25.15 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```
mysql> SHOW STATUS LIKE 'perf%';
+-----------------------------------------+-------+
| Variable_name                           | Value |
+-----------------------------------------+-------+
| Performance_schema_accounts_lost        | 0     |
| Performance_schema_cond_classes_lost    | 0     |
| Performance_schema_cond_instances_lost  | 0     |
| Performance_schema_file_classes_lost    | 0     |
| Performance_schema_file_handles_lost    | 0     |
| Performance_schema_file_instances_lost  | 0     |
| Performance_schema_hosts_lost           | 0     |
| Performance_schema_locker_lost          | 0     |
| Performance_schema_mutex_classes_lost   | 0     |
| Performance_schema_mutex_instances_lost | 0     |
| Performance_schema_rwlock_classes_lost  | 0     |
| Performance_schema_rwlock_instances_lost | 0     |
| Performance_schema_socket_classes_lost  | 0     |
| Performance_schema_socket_instances_lost | 0     |
| Performance_schema_stage_classes_lost   | 0     |
| Performance_schema_statement_classes_lost | 0     |
| Performance_schema_table_handles_lost   | 0     |
| Performance_schema_table_instances_lost | 0     |
| Performance_schema_thread_classes_lost  | 0     |
| Performance_schema_thread_instances_lost | 0     |
| Performance_schema_users_lost           | 0     |
+-----------------------------------------+-------+
```

Performance Schema status variables have the following meanings:

- `Performance_schema_accounts_lost`

  The number of times a row could not be added to the `accounts` table because it was full.

- `Performance_schema_cond_classes_lost`

  How many condition instruments could not be loaded.

- `Performance_schema_cond_instances_lost`

  How many condition instrument instances could not be created.

- `Performance_schema_digest_lost`

  The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- `Performance_schema_file_classes_lost`

  How many file instruments could not be loaded.

- `Performance_schema_file_handles_lost`

  How many file instrument instances could not be opened.

- `Performance_schema_file_instances_lost`

  How many file instrument instances could not be created.

- `Performance_schema_hosts_lost`

  The number of times a row could not be added to the `hosts` table because it was full.

- `Performance_schema_index_stat_lost`

  The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

- `Performance_schema_locker_lost`

  How many events are “lost” or not recorded, due to the following conditions:

  - Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
  - The depth of the nested events stack is greater than the limit imposed by the implementation.

  Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- `Performance_schema_memory_classes_lost`

  The number of times a memory instrument could not be loaded.

- `Performance_schema_metadata_lock_lost`

  The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.

- `Performance_schema_mutex_classes_lost`

  How many mutex instruments could not be loaded.

- `Performance_schema_mutex_instances_lost`

  How many mutex instrument instances could not be created.

- `Performance_schema_nested_statement_lost`

  The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

- `Performance_schema_prepared_statements_lost`

  The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

- `Performance_schema_program_lost`

  The number of stored programs for which statistics were lost. This can be nonzero if the value of `performance_schema_max_program_instances` is too small.

- `Performance_schema_rwlock_classes_lost`

  How many rwlock instruments could not be loaded.

- `Performance_schema_rwlock_instances_lost`

  How many rwlock instrument instances could not be created.

- `Performance_schema_session_connect_attrs_longest_seen`

  In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the `performance_schema_session_connect_attrs_size` system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable. If this value is larger than `performance_schema_session_connect_attrs_size`, DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

For more information about connection attributes, see Section 25.11.9, “Performance Schema Connection Attribute Tables”.

- `Performance_schema_session_connect_attrs_lost`

  The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key/value pairs for which the aggregate size is larger is larger than the reserved storage permitted by the value of the `performance_schema_session_connect_attrs_size` system variable, the Performance Schema truncates the attribute data and increments `Performance_schema_session_connect_attrs_lost`. If this value is nonzero, you may wish to set `performance_schema_session_connect_attrs_size` to a larger value.

  For more information about connection attributes, see Section 25.11.9, “Performance Schema Connection Attribute Tables”.

- `Performance_schema_socket_classes_lost`

  How many socket instruments could not be loaded.

- `Performance_schema_socket_instances_lost`

  How many socket instrument instances could not be created.

- `Performance_schema_stage_classes_lost`

  How many stage instruments could not be loaded.

- `Performance_schema_statement_classes_lost`

  How many statement instruments could not be loaded.

- `Performance_schema_table_handles_lost`

  How many table instrument instances could not be opened. This can be nonzero if the value of `performance_schema_max_table_handles` is too small.

- `Performance_schema_table_instances_lost`

  How many table instrument instances could not be created.

- `Performance_schema_table_lock_stat_lost`

  The number of tables for which lock statistics were lost. This can be nonzero if the value of `performance_schema_max_table_lock_stat` is too small.

- `Performance_schema_thread_classes_lost`

  How many thread instruments could not be loaded.

- `Performance_schema_thread_instances_lost`

  The number of thread instances that could not be instrumented in the `threads` table. This can be nonzero if the value of `performance_schema_max_thread_instances` is too small.

- `Performance_schema_users_lost`

  The number of times a row could not be added to the `users` table because it was full.

For information on using these variables to check Performance Schema status, see Section 25.7, “Performance Schema Status Monitoring”.

25.16 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

```
performance_schema_accounts_size
performance_schema_hosts_size
performance_schema_max_cond_instances
performance_schema_max_file_instances
performance_schema_max_index_stat
performance_schema_max_metadata_locks
performance_schema_max_mutex_instances
performance_schema_max_prepared_statements_instances
performance_schema_max_program_instances
performance_schema_max_rwlock_instances
performance_schema_max_socket_instances
performance_schema_max_table_handles
performance_schema_max_table_instances
performance_schema_max_table_lock_stat
performance_schema_max_thread_instances
performance_schema_users_size
```

For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.
- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
- With the value set to *N* > 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches *N*.
  - Once the buffer size reaches *N*, no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory

is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_xxx_by_event_name` tables.

This query shows the information associated with the memory instruments:

```
SELECT * FROM memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/%';
```

25.17 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see Section 25.7, “Performance Schema Status Monitoring”.

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

25.18 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in Section 25.4.2, “Performance Schema Event Filtering”.

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.
2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis will rely heavily on post-filtering.
3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.
4. Repeat the process at step 1.

   At each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, will contain less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, will contain more and more data relevant to the analysis of the problem at hand.

   At each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio will improve, making analysis easier.
5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:

   - Tune the server parameters (cache sizes, memory, and so forth).
   - Tune a query by writing it differently,

- Tune the database schema (tables, indexes, and so forth).
- Tune the code (this applies to storage engine or server developers only).

6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

```
SELECT * FROM events_waits_current WHERE THREAD_ID = thread_1;
```

   Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

```
SELECT * FROM mutex_instances WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
```

   Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```
SELECT * FROM events_waits_current WHERE THREAD_ID = thread_2;
```

25.18.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that will run the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+------+------+------+---------+---------+
| HOST | USER | ROLE | ENABLED | HISTORY |
+------+------+------+---------+---------+
| %    | %    | %    | YES     | YES     |
+------+------+------+---------+---------+
```

   Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that will run the query:

```
mysql> UPDATE performance_schema.setup_actors SET ENABLED = 'NO', HISTORY = 'NO'
       WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors (HOST,USER,ROLE,ENABLED,HISTORY)
       VALUES('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----------+-----------+------+---------+---------+
| HOST      | USER      | ROLE | ENABLED | HISTORY |
+-----------+-----------+------+---------+---------+
| %         | %         | %    | NO      | NO      |
| localhost | test_user | %    | YES     | YES     |
+-----------+-----------+------+---------+---------+
```

2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES', TIMED = 'YES'
       WHERE NAME LIKE '%statement/%';

mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES', TIMED = 'YES'
       WHERE NAME LIKE '%stage/%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_consumers SET ENABLED = 'YES'
       WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers SET ENABLED = 'YES'
       WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```
mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;
+--------+------------+------------+-----------+--------+------------+
| emp_no | birth_date | first_name | last_name | gender | hire_date |
+--------+------------+------------+-----------+--------+------------+
|  10001 | 1953-09-02 | Georgi     | Facello   | M      | 1986-06-26 |
+--------+------------+------------+-----------+--------+------------+
```

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```
mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
       FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';
+----------+----------+-----------------------------------------------------------+
| event_id | duration | sql_text                                                  |
+----------+----------+-----------------------------------------------------------+
|       31 | 0.028310 | SELECT * FROM employees.employees WHERE emp_no = 10001 |
+----------+----------+-----------------------------------------------------------+
```

6. Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```
mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
       FROM performance_schema.events_stages_history_long WHERE NESTING_EVENT_ID=31;
+--------------------------------+----------+
```

```
| Stage                          | Duration |
+--------------------------------+----------+
| stage/sql/starting             | 0.000080 |
| stage/sql/checking permissions | 0.000005 |
| stage/sql/Opening tables       | 0.027759 |
| stage/sql/init                 | 0.000052 |
| stage/sql/System lock          | 0.000009 |
| stage/sql/optimizing           | 0.000006 |
| stage/sql/statistics           | 0.000082 |
| stage/sql/preparing            | 0.000008 |
| stage/sql/executing            | 0.000000 |
| stage/sql/Sending data         | 0.000017 |
| stage/sql/end                  | 0.000001 |
| stage/sql/query end            | 0.000004 |
| stage/sql/closing tables       | 0.000006 |
| stage/sql/freeing items        | 0.000272 |
| stage/sql/cleaning up          | 0.000001 |
+--------------------------------+----------+
```

Chapter 26 MySQL sys Schema

Table of Contents

26.1 Prerequisites for Using the sys Schema 3155
26.2 Using the sys Schema 3156
26.3 sys Schema Progress Reporting 3157
26.4 sys Schema Object Reference 3158
26.4.1 sys Schema Object Index 3158
26.4.2 sys Schema Tables and Triggers 3162
26.4.3 sys Schema Views 3164
26.4.4 sys Schema Stored Procedures 3203
26.4.5 sys Schema Stored Functions 3222

MySQL 8.0 includes the `sys` schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. `sys` schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the `sys` schema is installed by default during data directory initialization if you use `mysqld` with the `--initialize` or `--initialize-insecure` option. If this is not desired, you can drop the `sys` schema manually after initialization if it is unneeded.

`mysql_upgrade` returns an error if a `sys` schema exists but has no `version` view, on the assumption that absence of this view indicates a user-created `sys` schema. To upgrade in this case, remove or rename the existing `sys` schema first.

`sys` schema objects have a `DEFINER` of `'mysql.sys'@'localhost'`. Use of the dedicated `mysql.sys` account avoids problems that occur if a DBA renames or removes the `root` account.

26.1 Prerequisites for Using the sys Schema

Before using the `sys` schema, the prerequisites described in this section must be satisfied.

The `sys` schema requires MySQL 5.6 or higher.

Because the `sys` schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the `sys` schema to work. See Section 25.3, “Performance Schema Startup Configuration”.

For full access to the `sys` schema, a user must have these privileges:

- `SELECT` on all `sys` tables and views
- `EXECUTE` on all `sys` stored procedures and functions
- `INSERT` and `UPDATE` for the `sys_config` table, if changes are to be made to it
- Additional privileges for certain `sys` schema stored procedures and functions, as noted in their descriptions; for example, the `ps_setup_save()` procedure

It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- `SELECT` on any Performance Schema tables accessed by `sys` schema objects, and `UPDATE` for any tables to be updated using `sys` schema objects

- `PROCESS` for the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- *`xxx`*`_current` and *`xxx`*`_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

Note

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```
CALL sys.ps_setup_reset_to_default(TRUE);
```

26.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
+-------------+---------------------+
| sys_version | mysql_version       |
+-------------+---------------------+
| 1.6.0       | 8.0.2-dmr-debug-log |
+-------------+---------------------+
```

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```
mysql> SELECT * FROM sys.version;
+-------------+---------------------+
| sys_version | mysql_version       |
+-------------+---------------------+
| 1.6.0       | 8.0.2-dmr-debug-log |
+-------------+---------------------+
```

Examples in this chapter usually assume `sys` as the default schema.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other

member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM host_summary_by_file_io;
+------------+-------+------------+
| host       | ios   | io_latency |
+------------+-------+------------+
| localhost  | 67570 | 5.38 s     |
| background |  3468 | 4.18 s     |
+------------+-------+------------+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM x$host_summary_by_file_io;
+------------+-------+---------------+
| host       | ios   | io_latency    |
+------------+-------+---------------+
| localhost  | 67574 | 5380678125144 |
| background |  3474 | 4758696829416 |
+------------+-------+---------------+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see Section 26.4.3, “sys Schema Views”.

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW session;
mysql> SHOW CREATE FUNCTION format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files available from the `sys` schema development web site at https://github.com/mysql/mysql-sys.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

26.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

```
stage/sql/Copying to tmp table
stage/innodb/alter table (end)
stage/innodb/alter table (flush)
stage/innodb/alter table (insert)
stage/innodb/alter table (log apply index)
stage/innodb/alter table (log apply table)
stage/innodb/alter table (merge sort)
stage/innodb/alter table (read PK and internal sort)
stage/innodb/buffer pool load
```

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

26.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

26.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

Table 26.1 sys Schema Tables and Triggers

Table or Trigger Name	Description
`sys_config`	`sys` schema configuration options
`sys_config_insert_set_user`	`sys_config` insert trigger
`sys_config_update_set_user`	`sys_config` update trigger

Table 26.2 sys Schema Views

View Name	Description
`host_summary`, `x$host_summary`	Statement activity, file I/O, and connections, grouped by host
`host_summary_by_file_io`, `x$host_summary_by_file_io`	File I/O, grouped by host
`host_summary_by_file_io_type`, `x$host_summary_by_file_io_type`	File I/O, grouped by host and event type
`host_summary_by_stages`, `x$host_summary_by_stages`	Statement stages, grouped by host
`host_summary_by_statement_latency`, `x$host_summary_by_statement_latency`	Statement statistics, grouped by host
`host_summary_by_statement_type`, `x$host_summary_by_statement_type`	Statements executed, grouped by host and statement
`innodb_buffer_stats_by_schema`, `x$innodb_buffer_stats_by_schema`	`InnoDB` buffer information, grouped by schema
`innodb_buffer_stats_by_table`, `x$innodb_buffer_stats_by_table`	`InnoDB` buffer information, grouped by schema and table
`innodb_lock_waits`, `x$innodb_lock_waits`	`InnoDB` lock information
`io_by_thread_by_latency`, `x$io_by_thread_by_latency`	I/O consumers, grouped by thread

View Name	Description
io_global_by_file_by_bytes, x$io_global_by_file_by_bytes	Global I/O consumers, grouped by file and bytes
io_global_by_file_by_latency, x$io_global_by_file_by_latency	Global I/O consumers, grouped by file and latency
io_global_by_wait_by_bytes, x$io_global_by_wait_by_bytes	Global I/O consumers, grouped by bytes
io_global_by_wait_by_latency, x$io_global_by_wait_by_latency	Global I/O consumers, grouped by latency
latest_file_io, x$latest_file_io	Most recent I/O, grouped by file and thread
memory_by_host_by_current_bytes, x$memory_by_host_by_current_bytes	Memory use, grouped by host
memory_by_thread_by_current_bytes, x$memory_by_thread_by_current_bytes	Memory use, grouped by thread
memory_by_user_by_current_bytes, x$memory_by_user_by_current_bytes	Memory use, grouped by user
memory_global_by_current_bytes, x$memory_global_by_current_bytes	Memory use, grouped by allocation type
memory_global_total, x$memory_global_total	Total memory use
metrics	Server metrics
processlist, x$processlist	Processlist information
ps_check_lost_instrumentation	Variables that have lost instruments
schema_auto_increment_columns	AUTO_INCREMENT column information
schema_index_statistics, x$schema_index_statistics	Index statistics
schema_object_overview	Types of objects within each schema
schema_redundant_indexes	Duplicate or redundant indexes
schema_table_lock_waits, x$schema_table_lock_waits	Sessions waiting for metadata locks
schema_table_statistics, x$schema_table_statistics	Table statistics
schema_table_statistics_with_buffer, x$schema_table_statistics_with_buffer	Table statistics, including InnoDB buffer pool statistics
schema_tables_with_full_table_scans, x$schema_tables_with_full_table_scans	Tables being accessed with full scans
schema_unused_indexes	Indexes not in active use
session, x$session	Processlist information for user sessions
session_ssl_status	Connection SSL information
statement_analysis, x$statement_analysis	Statement aggregate statistics
statements_with_errors_or_warnings, x$statements_with_errors_or_warnings	Statements that have produced errors or warnings
statements_with_full_table_scans, x$statements_with_full_table_scans	Statements that have done full table scans
statements_with_runtimes_in_95th_percentile, x$statements_with_runtimes_in_95th_percentile	Statements with highest average runtime

View Name	Description
statements_with_sorting, x$statements_with_sorting	Statements that performed sorts
statements_with_temp_tables, x$statements_with_temp_tables	Statements that used temporary tables
user_summary, x$user_summary	User statement and connection activity
user_summary_by_file_io, x$user_summary_by_file_io	File I/O, grouped by user
user_summary_by_file_io_type, x$user_summary_by_file_io_type	File I/O, grouped by user and event
user_summary_by_stages, x$user_summary_by_stages	Stage events, grouped by user
user_summary_by_statement_latency, x$user_summary_by_statement_latency	Statement statistics, grouped by user
user_summary_by_statement_type, x$user_summary_by_statement_type	Statements executed, grouped by user and statement
version	Current sys schema and MySQL server versions
wait_classes_global_by_avg_latency, x$wait_classes_global_by_avg_latency	Wait class average latency, grouped by event class
wait_classes_global_by_latency, x$wait_classes_global_by_latency	Wait class total latency, grouped by event class
waits_by_host_by_latency, x$waits_by_host_by_latency	Wait events, grouped by host and event
waits_by_user_by_latency, x$waits_by_user_by_latency	Wait events, grouped by user and event
waits_global_by_latency, x$waits_global_by_latency	Wait events, grouped by event
x$ps_digest_95th_percentile_by_avg_us	Helper view for 95th-percentile views
x$ps_digest_avg_latency_distribution	Helper view for 95th-percentile views
x$ps_schema_table_statistics_io	Helper view for table-statistics views
x$schema_flattened_keys	Helper view for schema_redundant_indexes

Table 26.3 sys Schema Stored Procedures

Procedure Name	Description
create_synonym_db()	Create synonym for schema
diagnostics()	Collect system diagnostic information
execute_prepared_stmt()	Execute prepared statement
ps_setup_disable_background_threads()	Disable background thread instrumentation
ps_setup_disable_consumer()	Disable consumers
ps_setup_disable_instrument()	Disable instruments
ps_setup_disable_thread()	Disable instrumentation for thread
ps_setup_enable_background_threads()	Enable background thread instrumentation
ps_setup_enable_consumer()	Enable consumers

Procedure Name	Description
ps_setup_enable_instrument()	Enable instruments
ps_setup_enable_thread()	Enable instrumentation for thread
ps_setup_reload_saved()	Reload saved Performance Schema configuration
ps_setup_reset_to_default()	Reset saved Performance Schema configuration
ps_setup_save()	Save Performance Schema configuration
ps_setup_show_disabled()	Display disabled Performance Schema configuration
ps_setup_show_disabled_consumers()	Display disabled Performance Schema consumers
ps_setup_show_disabled_instruments()	Display disabled Performance Schema instruments
ps_setup_show_enabled()	Display enabled Performance Schema configuration
ps_setup_show_enabled_consumers()	Display enabled Performance Schema consumers
ps_setup_show_enabled_instruments()	Display enabled Performance Schema instruments
ps_statement_avg_latency_histogram()	Display statement latency histogram
ps_trace_statement_digest()	Trace Performance Schema instrumentation for digest
ps_trace_thread()	Dump Performance Schema data for thread
ps_truncate_all_tables()	Truncate Performance Schema summary tables
statement_performance_analyzer()	Report of statements running on server
table_exists()	Whether a table exists

Table 26.4 sys Schema Stored Functions

Function Name	Description
extract_schema_from_file_name()	Extract schema name from file path name
extract_table_from_file_name()	Extract table name from file path name
format_bytes()	Convert byte value to value with units
format_path()	Replace data and temp-file directories in path name with symbolic values
format_statement()	Truncate long statement to fixed length
format_time()	Convert picoseconds value to value with units
list_add()	Add item to list
list_drop()	Remove item from list
ps_is_account_enabled()	Check whether account instrumentation is enabled
ps_is_consumer_enabled()	Check whether consumer is enabled

Function Name	Description
ps_is_instrument_default_enabled()	Check whether instrument is enabled
ps_is_instrument_default_timed()	Check whether instrument is timed
ps_is_thread_instrumented()	Check whether thread is instrumented
ps_thread_account()	Return account for thread ID
ps_thread_id()	Return thread ID for connection ID
ps_thread_stack()	Return event information for thread ID
ps_thread_trx_info()	Return transaction information for thread ID
quote_identifier()	Return string as quoted identifier
sys_get_config()	Return sys schema configuration option
version_major()	MySQL server major version number
version_minor()	MySQL server minor version number
version_patch()	MySQL server patch release version number

26.4.2 sys Schema Tables and Triggers

The following sections describe sys schema tables and triggers.

26.4.2.1 The sys_config Table

This table contains sys schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The sys_config table has these columns:

- variable

  The configuration option name.

- value

  The configuration option value.

- set_time

  The timestamp of the most recent modification to the row.

- set_by

  The account that made the most recent modification to the row. The value is NULL if the row has not been changed since the sys schema was installed.

As an efficiency measure to minimize the number of direct reads from the sys_config table, sys schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a @sys. prefix. (For example, the variable corresponding to the diagnostics.include_raw option is @sys.diagnostics.include_raw.) If the user-defined variable exists in the current session and is non-NULL, the function uses its value in preference to the value in the sys_config table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT format_statement(@stmt);
+-------------------------------------------------------+
| format_statement(@stmt)                               |
+-------------------------------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-------------------------------------------------------+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT format_statement(@stmt);
+----------------------------------+
| format_statement(@stmt)          |
+----------------------------------+
| SELECT variabl ... ROM sys_config |
+----------------------------------+
```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to `NULL` within your session:

```
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT format_statement(@stmt);
+-------------------------------------------------------+
| format_statement(@stmt)                               |
+-------------------------------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-------------------------------------------------------+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value will not be used in that session as long as the user-defined variable exists with a non-`NULL` value. (The changed table value *will* be used in other sessions that do not have the user-defined variable assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

  If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

  If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

  The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- `statement_performance_analyzer.limit`, `@sys.statement_performance_analyzer.limit`

  The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- `statement_performance_analyzer.view`, `@sys.statement_performance_analyzer.view`

  The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is `NULL` (no custom view defined).

- `statement_truncate_len`, `@sys.statement_truncate_len`

  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```
mysql> INSERT INTO sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```
mysql> UPDATE sys_config SET value = 'OFF' WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

26.4.2.2 The sys_config_insert_set_user Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

26.4.2.3 The sys_config_update_set_user Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

26.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
```

```
mysql> SELECT * FROM host_summary_by_file_io;
+------------+-------+------------+
| host       | ios   | io_latency |
+------------+-------+------------+
| localhost  | 67570 | 5.38 s     |
| background |  3468 | 4.18 s     |
+------------+-------+------------+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM x$host_summary_by_file_io;
+------------+-------+---------------+
| host       | ios   | io_latency    |
+------------+-------+---------------+
| localhost  | 67574 | 5380678125144 |
| background |  3474 | 4758696829416 |
+------------+-------+---------------+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `x$` prefix differ from the corresponding `x$` views in these ways:

- Byte values are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path name are shortened using `format_path()`.

26.4.3.1 The host_summary and x$host_summary Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

  The total number of statements for the host.

- `statement_latency`

  The total wait time of timed statements for the host.

- `statement_avg_latency`

  The average wait time per timed statement for the host.

- `table_scans`

  The total number of table scans for the host.

- `file_ios`

  The total number of file I/O events for the host.

- `file_io_latency`

  The total wait time of timed file I/O events for the host.

- `current_connections`

  The current number of connections for the host.

- `total_connections`

  The total number of connections for the host.

- `unique_users`

  The number of distinct users for the host.

- `current_memory`

  The current amount of allocated memory for the host.

- `total_memory_allocated`

  The total amount of allocated memory for the host.

26.4.3.2 The host_summary_by_file_io and x$host_summary_by_file_io Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

  The total number of file I/O events for the host.

- `io_latency`

  The total wait time of timed file I/O events for the host.

26.4.3.3 The host_summary_by_file_io_type and x$host_summary_by_file_io_type Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

  The file I/O event name.

- `total`

  The total number of occurrences of the file I/O event for the host.

- `total_latency`

  The total wait time of timed occurrences of the file I/O event for the host.

- `max_latency`

  The maximum single wait time of timed occurrences of the file I/O event for the host.

26.4.3.4 The host_summary_by_stages and x$host_summary_by_stages Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

  The stage event name.

- `total`

  The total number of occurrences of the stage event for the host.

- `total_latency`

  The total wait time of timed occurrences of the stage event for the host.

- `avg_latency`

  The average wait time per timed occurrence of the stage event for the host.

26.4.3.5 The host_summary_by_statement_latency and x$host_summary_by_statement_latency Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

  The total number of statements for the host.

- `total_latency`

  The total wait time of timed statements for the host.

- `max_latency`

  The maximum single wait time of timed statements for the host.

- `lock_latency`

  The total time waiting for locks by timed statements for the host.

- `rows_sent`

  The total number of rows returned by statements for the host.

- `rows_examined`

  The total number of rows read from storage engines by statements for the host.

- `rows_affected`

  The total number of rows affected by statements for the host.

- `full_scans`

  The total number of full table scans by statements for the host.

26.4.3.6 The host_summary_by_statement_type and x$host_summary_by_statement_type Views

These views summarize informaion about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

  The final component of the statement event name.

- `total`

  The total number of occurrences of the statement event for the host.

- `total_latency`

  The total wait time of timed occurrences of the statement event for the host.

- `max_latency`

  The maximum single wait time of timed occurrences of the statement event for the host.

- `lock_latency`

  The total time waiting for locks by timed occurrences of the statement event for the host.

- `rows_sent`

  The total number of rows returned by occurrences of the statement event for the host.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the host.

- `rows_affected`

  The total number of rows affected by occurrences of the statement event for the host.

- `full_scans`

  The total number of full table scans by occurrences of the statement event for the host.

26.4.3.7 The innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema. By default, rows are sorted by descending buffer size.

The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` views have these columns:

- `object_schema`

  The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `allocated`

  The total number of bytes allocated for the schema.

- `data`

  The total number of data bytes allocated for the schema.

- `pages`

  The total number of pages allocated for the schema.

- `pages_hashed`

  The total number of hashed pages allocated for the schema.

- `pages_old`

  The total number of old pages allocated for the schema.

- `rows_cached`

  The total number of cached rows for the schema.

26.4.3.8 The innodb_buffer_stats_by_table and x$innodb_buffer_stats_by_table Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema and table. By default, rows are sorted by descending buffer size.

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views have these columns:

- `object_schema`

  The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `object_name`

  The table name.

- `allocated`

  The total number of bytes allocated for the table.

- `data`

  The number of data bytes allocated for the table.

- `pages`

  The total number of pages allocated for the table.

- `pages_hashed`

  The number of hashed pages allocated for the table.

- `pages_old`

  The number of old pages allocated for the table.

- `rows_cached`

  The number of cached rows for the table.

26.4.3.9 The innodb_lock_waits and x$innodb_lock_waits Views

These views summarize the `InnoDB` locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- `wait_started`

  The time at which the lock wait started.

- `wait_age`

  How long the lock has been waited for, as a `TIME` value.

- `wait_age_secs`

  How long the lock has been waited for, in seconds.

- `locked_table_schema`

  The schema that contains the locked table.

- `locked_table_name`

  The name of the locked table.

- `locked_table_partition`

  The name of the locked partition, if any; `NULL` otherwise.

- `locked_table_subpartition`

  The name of the locked subpartition, if any; `NULL` otherwise.

- `locked_index`

The name of the locked index.

- `locked_type`

  The type of the waiting lock.

- `waiting_trx_id`

  The ID of the waiting transaction.

- `waiting_trx_started`

  The time at which the waiting transaction started.

- `waiting_trx_age`

  How long the waiting transaction has been waiting, as a `TIME` value.

- `waiting_trx_rows_locked`

  The number of rows locked by the waiting transaction.

- `waiting_trx_rows_modified`

  The number of rows modified by the waiting transaction.

- `waiting_pid`

  The processlist ID of the waiting transaction.

- `waiting_query`

  The statement that is waiting for the lock.

- `waiting_lock_id`

  The ID of the waiting lock.

- `waiting_lock_mode`

  The mode of the waiting lock.

- `blocking_trx_id`

  The ID of the transaction that is blocking the waiting lock.

- `blocking_pid`

  The processlist ID of the blocking transaction.

- `blocking_query`

  The statement the blocking transaction is executing.

- `blocking_lock_id`

  The ID of the lock that is blocking the waiting lock.

- `blocking_lock_mode`

  The mode of the lock that is blocking the waiting lock.

- `blocking_trx_started`

The time at which the blocking transaction started.

- `blocking_trx_age`

  How long the blocking transaction has been executing, as a `TIME` value.

- `blocking_trx_rows_locked`

  The number of rows locked by the blocking transaction.

- `blocking_trx_rows_modified`

  The number of rows modified by the blocking transaction.

- `sql_kill_blocking_query`

  The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

  The `KILL` statement to execute to kill the session running the blocking statement.

26.4.3.10 The io_by_thread_by_latency and x$io_by_thread_by_latency Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- `user`

  For foreground threads, the account associated with the thread. For background threads, the thread name.

- `total`

  The total number of I/O events for the thread.

- `total_latency`

  The total wait time of timed I/O events for the thread.

- `min_latency`

  The minimum single wait time of timed I/O events for the thread.

- `avg_latency`

  The average wait time per timed I/O event for the thread.

- `max_latency`

  The maximum single wait time of timed I/O events for the thread.

- `thread_id`

  The thread ID.

- `processlist_id`

  For foreground threads, the processlist ID of the thread. For background threads, `NULL`.

26.4.3.11 The io_global_by_file_by_bytes and x$io_global_by_file_by_bytes Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- `file`

  The file path name.

- `count_read`

  The total number of read events for the file.

- `total_read`

  The total number of bytes read from the file.

- `avg_read`

  The average number of bytes per read from the file.

- `count_write`

  The total number of write events for the file.

- `total_written`

  The total number of bytes written to the file.

- `avg_write`

  The average number of bytes per write to the file.

- `total`

  The total number of bytes read and written for the file.

- `write_pct`

  The percentage of total bytes of I/O that were writes.

26.4.3.12 The io_global_by_file_by_latency and x$io_global_by_file_by_latency Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- `file`

  The file path name.

- `total`

  The total number of I/O events for the file.

- `total_latency`

  The total wait time of timed I/O events for the file.

- `count_read`

The total number of read I/O events for the file.

- `read_latency`

  The total wait time of timed read I/O events for the file.

- `count_write`

  The total number of write I/O events for the file.

- `write_latency`

  The total wait time of timed write I/O events for the file.

- `count_misc`

  The total number of other I/O events for the file.

- `misc_latency`

  The total wait time of timed other I/O events for the file.

26.4.3.13 The io_global_by_wait_by_bytes and x$io_global_by_wait_by_bytes Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- `event_name`

  The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

  The total number of occurrences of the I/O event.

- `total_latency`

  The total wait time of timed occurrences of the I/O event.

- `min_latency`

  The minimum single wait time of timed occurrences of the I/O event.

- `avg_latency`

  The average wait time per timed occurrence of the I/O event.

- `max_latency`

  The maximum single wait time of timed occurrences of the I/O event.

- `count_read`

  The number of read requests for the I/O event.

- `total_read`

  The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

  The number of write requests for the I/O event.

- `total_written`

  The number of bytes written for the I/O event.

- `avg_written`

  The average number of bytes per write for the I/O event.

- `total_requested`

  The total number of bytes read and written for the I/O event.

26.4.3.14 The io_global_by_wait_by_latency and x$io_global_by_wait_by_latency Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- `event_name`

  The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

  The total number of occurrences of the I/O event.

- `total_latency`

  The total wait time of timed occurrences of the I/O event.

- `avg_latency`

  The average wait time per timed occurrence of the I/O event.

- `max_latency`

  The maximum single wait time of timed occurrences of the I/O event.

- `read_latency`

  The total wait time of timed read occurrences of the I/O event.

- `write_latency`

  The total wait time of timed write occurrences of the I/O event.

- `misc_latency`

  The total wait time of timed other occurrences of the I/O event.

- `count_read`

  The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

  The average number of bytes per read for the I/O event.

- `count_write`

  The number of write requests for the I/O event.

- `total_written`

  The number of bytes written for the I/O event.

- `avg_written`

  The average number of bytes per write for the I/O event.

26.4.3.15 The latest_file_io and x$latest_file_io Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The `latest_file_io` and `x$latest_file_io` views have these columns:

- `thread`

  For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID

- `file`

  The file path name.

- `latency`

  The wait time of the file I/O event.

- `operation`

  The type of operation.

- `requested`

  The number of data bytes requested for the file I/O event.

26.4.3.16 The memory_by_host_by_current_bytes and x$memory_by_host_by_current_bytes Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- `host`

  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the host.

- `current_allocated`

  The current number of allocated bytes that have not been freed yet for the host.

- `current_avg_alloc`

  The current number of allocated bytes per memory block for the host.

- `current_max_alloc`

  The largest single current memory allocation in bytes for the host.

- `total_allocated`

  The total memory allocation in bytes for the host.

26.4.3.17 The memory_by_thread_by_current_bytes and x$memory_by_thread_by_current_bytes Views

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- `thread_id`

  The thread ID.

- `user`

  The thread user or thread name.

- `current_count_used`

  The current number of allocated memory blocks that have not been freed yet for the thread.

- `current_allocated`

  The current number of allocated bytes that have not been freed yet for the thread.

- `current_avg_alloc`

  The current number of allocated bytes per memory block for the thread.

- `current_max_alloc`

  The largest single current memory allocation in bytes for the thread.

- `total_allocated`

  The total memory allocation in bytes for the thread.

26.4.3.18 The memory_by_user_by_current_bytes and x$memory_by_user_by_current_bytes Views

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

  The current number of allocated memory blocks that have not been freed yet for the user.

- `current_allocated`

  The current number of allocated bytes that have not been freed yet for the user.

- `current_avg_alloc`

  The current number of allocated bytes per memory block for the user.

- `current_max_alloc`

  The largest single current memory allocation in bytes for the user.

- `total_allocated`

  The total memory allocation in bytes for the user.

26.4.3.19 The memory_global_by_current_bytes and x$memory_global_by_current_bytes Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`

  The memory event name.

- `current_count`

  The total number of occurrences of the event.

- `current_alloc`

  The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`

  The current number of allocated bytes per memory block for the event.

- `high_count`

  The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`

  The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`

  The high-water mark for average number of bytes per memory block allocated for the event.

26.4.3.20 The memory_global_total and x$memory_global_total Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`

  The total bytes of memory allocated within the server.

26.4.3.21 The metrics View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table
- `InnoDB` metrics from the `INFORMATION_SCHEMA INNODB_METRICS` table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- `Variable_name`

  The metric name. The metric type determines the source from which the name is taken:

  - For global status variables: The `VARIABLE_NAME` column of the `global_status` table
  - For `InnoDB` metrics: The `NAME` column of the `INNODB_METRICS` table
  - For other metrics: A view-provided descriptive string

- `Variable_value`

  The metric value. The metric type determines the source from which the value is taken:

  - For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
  - For `InnoDB` metrics: The `COUNT` column of the `INNODB_METRICS` table
  - For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
  - For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- `Type`

  The metric type:

  - For global status variables: `Global Status`
  - For `InnoDB` metrics: `InnoDB Metrics - %`, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table
  - For memory metrics: `Performance Schema`

  - For the current time: `System Time`

- `Enabled`

  Whether the metric is enabled:

  - For global status variables: `YES`
  - For `InnoDB` metrics: `YES` if the `STATUS` column of the `INNODB_METRICS` table is `enabled`, `NO` otherwise
  - For memory metrics: `NO`, `YES`, or `PARTIAL` (currently, `PARTIAL` occurs only for memory metrics and indicates that not all `memory/%` instruments are enabled; Performance Schema memory instruments are always enabled)
  - For the current time: `YES`

26.4.3.22 The processlist and x$processlist Views

These views summarize processlist information. They provide more complete information than the `SHOW PROCESSLIST` statement and the `INFORMATION_SCHEMA PROCESSLIST` table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `threads` table at Section 25.11.16.3, “The threads Table”.

The `processlist` and `x$processlist` views have these columns:

- `thd_id`

  The thread ID.

- `conn_id`

  The connection ID.

- `user`

  The thread user or thread name.

- `db`

  The default database for the thread, or `NULL` if there is none.

- `command`

  For foreground threads, the type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle.

- `state`

  An action, event, or state that indicates what the thread is doing.

- `time`

  The time in seconds that the thread has been in its current state.

- `current_statement`

  The statement the thread is executing, or `NULL` if it is not executing any statement.

- `statement_latency`

How long the statement has been executing.

- `progress`

  The percentage of work completed for stages that support progress reporting. See Section 26.3, “sys Schema Progress Reporting”.

- `lock_latency`

  The time spent waiting for locks by the current statement.

- `rows_examined`

  The number of rows read from storage engines by the current statement.

- `rows_sent`

  The number of rows returned by the current statement.

- `rows_affected`

  The number of rows affected by the current statement.

- `tmp_tables`

  The number of internal in-memory temporary tables created by the current statement.

- `tmp_disk_tables`

  The number of internal on-disk temporary tables created by the current statement.

- `full_scan`

  The number of full table scans performed by the current statement.

- `last_statement`

  The last statement executed by the thread, if there is no currently executing statement or wait.

- `last_statement_latency`

  How long the last statement executed.

- `current_memory`

  The number of bytes allocated by the thread.

- `last_wait`

  The name of the most recent wait event for the thread.

- `last_wait_latency`

  The wait time of the most recent wait event for the thread.

- `source`

  The source file and line number containing the instrumented code that produced the event.

- `trx_latency`

  The wait time of the current transaction for the thread.

- `trx_state`

The state for the current transaction for the thread.

- `trx_autocommit`

  Whether autocommit mode was enabled when the current transaction started.

- `pid`

  The client process ID.

- `program_name`

  The client program name.

26.4.3.23 The ps_check_lost_instrumentation View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- `variable_name`

  The Performance Schema status variable name indicating which type of instrument was lost.

- `variable_value`

  The number of instruments lost.

26.4.3.24 The schema_auto_increment_columns View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table that contains the `AUTO_INCREMENT` column.

- `column_name`

  The name of the `AUTO_INCREMENT` column.

- `data_type`

  The data type of the column.

- `column_type`

  The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`

Whether the column type is signed.

- `is_unsigned`

  Whether the column type is unsigned.

- `max_value`

  The maximum permitted value for the column.

- `auto_increment`

  The current `AUTO_INCREMENT` value for the column.

- `auto_increment_ratio`

  The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

26.4.3.25 The schema_index_statistics and x$schema_index_statistics Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table that contains the index.

- `index_name`

  The name of the index.

- `rows_selected`

  The total number of rows read using the index.

- `select_latency`

  The total wait time of timed reads using the index.

- `rows_inserted`

  The total number of rows inserted into the index.

- `insert_latency`

  The total wait time of timed inserts into the index.

- `rows_updated`

  The total number of rows updated in the index.

- `update_latency`

  The total wait time of timed updates in the index.

- `rows_deleted`

The total number of rows deleted from the index.

- `delete_latency`

  The total wait time of timed deletes from the index.

26.4.3.26 The schema_object_overview View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

Note

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:

- `db`

  The schema name.

- `object_type`

  The object type: `BASE TABLE`, `INDEX (index_type)`, `EVENT`, `FUNCTION`, `PROCEDURE`, `TRIGGER`, `VIEW`.

- `count`

  The number of objects in the schema of the given type.

26.4.3.27 The schema_redundant_indexes and x$schema_flattened_keys Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table that contains the index.

- `redundant_index_name`

  The name of the redundant index.

- `redundant_index_columns`

  The names of the columns in the redundant index.

- `redundant_index_non_unique`

  The number of nonunique columns in the redundant index.

- `dominant_index_name`

  The name of the dominant index.

- `dominant_index_columns`

  The names of the columns in the dominant index.

- `dominant_index_non_unique`

  The number of nonunique columns in the dominant index.

- `subpart_exists`

  Whether the index indexes only part of a column.

- `sql_drop_index`

  The statement to execute to drop the redundant index.

The `x$schema_flattened_keys` view has these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table that contains the index.

- `index_name`

  An index name.

- `non_unique`

  The number of nonunique columns in the index.

- `subpart_exists`

  Whether the index indexes only part of a column.

- `index_columns`

  The name of the columns in the index.

26.4.3.28 The schema_table_lock_waits and x$schema_table_lock_waits Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at Section 25.11.12.3, “The metadata_locks Table”.

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- `object_schema`

  The schema containing the object to be locked.

- `object_name`

  The name of the instrumented object.

- `waiting_thread_id`

The thread ID of the thread that is waiting for the lock.

- `waiting_pid`

  The processlist ID of the thread that is waiting for the lock.

- `waiting_account`

  The account associated with the session that is waiting for the lock.

- `waiting_lock_type`

  The type of the waiting lock.

- `waiting_lock_duration`

  How long the waiting lock has been waiting.

- `waiting_query`

  The statement that is waiting for the lock.

- `waiting_query_secs`

  How long the statement has been waiting, in seconds.

- `waiting_query_rows_affected`

  The number of rows affected by the statement.

- `waiting_query_rows_examined`

  The number of rows read from storage engines by the statement.

- `blocking_thread_id`

  The thread ID of the thread that is blocking the waiting lock.

- `blocking_pid`

  The processlist ID of the thread that is blocking the waiting lock.

- `blocking_account`

  The account associated with the thread that is blocking the waiting lock.

- `blocking_lock_type`

  The type of lock that is blocking the waiting lock.

- `blocking_lock_duration`

  How long the blocking lock has been held.

- `sql_kill_blocking_query`

  The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

  The `KILL` statement to execute to kill the session running the blocking statement.

26.4.3.29 The schema_table_statistics and x$schema_table_statistics Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics` and `x$schema_table_statistics` views have these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table name.

- `total_latency`

  The total wait time of timed I/O events for the table.

- `rows_fetched`

  The total number of rows read from the table.

- `fetch_latency`

  The total wait time of timed read I/O events for the table.

- `rows_inserted`

  The total number of rows inserted into the table.

- `insert_latency`

  The total wait time of timed insert I/O events for the table.

- `rows_updated`

  The total number of rows updated in the table.

- `update_latency`

  The total wait time of timed update I/O events for the table.

- `rows_deleted`

  The total number of rows deleted from the table.

- `delete_latency`

  The total wait time of timed delete I/O events for the table.

- `io_read_requests`

  The total number of read requests for the table.

- `io_read`

  The total number of bytes read from the table.

- `io_read_latency`

  The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

  The total number of bytes written to the table.

- `io_write_latency`

  The total wait time of writes to the table.

- `io_misc_requests`

  The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

  The total wait time of miscellaneous I/O requests for the table.

26.4.3.30 The schema_table_statistics_with_buffer and x $schema_table_statistics_with_buffer Views

These views summarize table statistics, including `InnoDB` buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics_with_buffer` and `x $schema_table_statistics_with_buffer` views have these columns:

- `table_schema`

  The schema that contains the table.

- `table_name`

  The table name.

- `rows_fetched`

  The total number of rows read from the table.

- `fetch_latency`

  The total wait time of timed read I/O events for the table.

- `rows_inserted`

  The total number of rows inserted into the table.

- `insert_latency`

  The total wait time of timed insert I/O events for the table.

- `rows_updated`

  The total number of rows updated in the table.

- `update_latency`

  The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

  The total wait time of timed delete I/O events for the table.

- `io_read_requests`

  The total number of read requests for the table.

- `io_read`

  The total number of bytes read from the table.

- `io_read_latency`

  The total wait time of reads from the table.

- `io_write_requests`

  The total number of write requests for the table.

- `io_write`

  The total number of bytes written to the table.

- `io_write_latency`

  The total wait time of writes to the table.

- `io_misc_requests`

  The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

  The total wait time of miscellaneous I/O requests for the table.

- `innodb_buffer_allocated`

  The total number of `InnoDB` buffer bytes allocated for the table.

- `innodb_buffer_data`

  The total number of `InnoDB` data bytes allocated for the table.

- `innodb_buffer_free`

  The total number of `InnoDB` nondata bytes allocated for the table (`innodb_buffer_allocated` − `innodb_buffer_data`).

- `innodb_buffer_pages`

  The total number of `InnoDB` pages allocated for the table.

- `innodb_buffer_pages_hashed`

  The total number of `InnoDB` hashed pages allocated for the table.

- `innodb_buffer_pages_old`

  The total number of `InnoDB` old pages allocated for the table.

- `innodb_buffer_rows_cached`

The total number of `InnoDB` cached rows for the table.

26.4.3.31 The schema_tables_with_full_table_scans and x$schema_tables_with_full_table_scans Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` views have these columns:

- `object_schema`

  The schema name.

- `object_name`

  The table name.

- `rows_full_scanned`

  The total number of rows scanned by full scans of the table.

- `latency`

  The total wait time of full scans of the table.

26.4.3.32 The schema_unused_indexes View

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The `schema_unused_indexes` view has these columns:

- `object_schema`

  The schema name.

- `object_name`

  The table name.

- `index_name`

  The unused index name.

26.4.3.33 The session and x$session Views

These views are similar to `processlist` and `x$processlist`, but they filter out background processes to display only user sessions. For descriptions of the columns, see Section 26.4.3.22, “The processlist and x$processlist Views”.

26.4.3.34 The session_ssl_status View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The `session_ssl_status` view has these columns:

- `thread_id`

The thread ID for the connection.

- `ssl_version`

  The version of SSL used for the connection.

- `ssl_cipher`

  The SSL cipher used for the connection.

- `ssl_sessions_reused`

  The number of reused SSL sessions for the connection.

26.4.3.35 The statement_analysis and x$statement_analysis Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `full_scan`

  The total number of full table scans performed by occurrences of the statement.

- `exec_count`

  The total number of times the statement has executed.

- `err_count`

  The total number of errors produced by occurrences of the statement.

- `warn_count`

  The total number of warnings produced by occurrences of the statement.

- `total_latency`

  The total wait time of timed occurrences of the statement.

- `max_latency`

  The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

  The average wait time per timed occurrence of the statement.

- `lock_latency`

  The total time waiting for locks by timed occurrences of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

  The average number of rows returned per occurrence of the statement.

- `rows_examined`

  The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

  The average number of rows read from storage engines per occurrence of the statement.

- `rows_affected`

  The total number of rows affected by occurrences of the statement.

- `rows_affected_avg`

  The average number of rows affected per occurrence of the statement.

- `tmp_tables`

  The total number of internal in-memory temporary tables created by occurrences of the statement.

- `tmp_disk_tables`

  The total number of internal on-disk temporary tables created by occurrences of the statement.

- `rows_sorted`

  The total number of rows sorted by occurrences of the statement.

- `sort_merge_passes`

  The total number of sort merge passes by occurrences of the statement.

- `digest`

  The statement digest.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

26.4.3.36 The statements_with_errors_or_warnings and x$statements_with_errors_or_warnings Views

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `exec_count`

  The total number of times the statement has executed.

- `errors`

  The total number of errors produced by occurrences of the statement.

- `error_pct`

  The percentage of statement occurrences that produced errors.

- `warnings`

  The total number of warnings produced by occurrences of the statement.

- `warning_pct`

  The percentage of statement occurrences that produced warnings.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

- `digest`

  The statement digest.

26.4.3.37 The statements_with_full_table_scans and x$statements_with_full_table_scans Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `exec_count`

  The total number of times the statement has executed.

- `total_latency`

  The total wait time of timed statement events for the statement.

- `no_index_used_count`

  The total number of times no index was used to scan the table.

- `no_good_index_used_count`

  The total number of times no good index was used to scan the table.

- `no_index_used_pct`

  The percentage of the time no index was used to scan the table.

- `rows_sent`

  The total number of rows returned from the table.

- `rows_examined`

  The total number of rows read from the storage engine for the table.

- `rows_sent_avg`

  The average number of rows returned from the table.

- `rows_examined_avg`

  The average number of rows read from the storage engine for the table.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

- `digest`

  The statement digest.

26.4.3.38 The statements_with_runtimes_in_95th_percentile and x$statements_with_runtimes_in_95th_percentile Views

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, `x$ps_digest_avg_latency_distribution` and `x$ps_digest_95th_percentile_by_avg_us`.

The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `full_scan`

  The total number of full table scans performed by occurrences of the statement.

- `exec_count`

  The total number of times the statement has executed.

- `err_count`

  The total number of errors produced by occurrences of the statement.

- `warn_count`

  The total number of warnings produced by occurrences of the statement.

- `total_latency`

  The total wait time of timed occurrences of the statement.

- `max_latency`

  The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

  The average wait time per timed occurrence of the statement.

- `rows_sent`

  The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

  The average number of rows returned per occurrence of the statement.

- `rows_examined`

  The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

  The average number of rows read from storage engines per occurrence of the statement.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

- `digest`

  The statement digest.

26.4.3.39 The statements_with_sorting and x$statements_with_sorting Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

  The total wait time of timed occurrences of the statement.

- `sort_merge_passes`

  The total number of sort merge passes by occurrences of the statement.

- `avg_sort_merges`

  The average number of sort merge passes per occurrence of the statement.

- `sorts_using_scans`

  The total number of sorts using table scans by occurrences of the statement.

- `sort_using_range`

  The total number of sorts using range accesses by occurrences of the statement.

- `rows_sorted`

  The total number of rows sorted by occurrences of the statement.

- `avg_rows_sorted`

  The average number of rows sorted per occurrence of the statement.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

- `digest`

  The statement digest.

26.4.3.40 The statements_with_temp_tables and x$statements_with_temp_tables Views

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- `query`

  The normalized statement string.

- `db`

  The default database for the statement, or `NULL` if there is none.

- `exec_count`

  The total number of times the statement has executed.

- `total_latency`

  The total wait time of timed occurrences of the statement.

- `memory_tmp_tables`

  The total number of internal in-memory temporary tables created by occurrences of the statement.

- `disk_tmp_tables`

  The total number of internal on-disk temporary tables created by occurrences of the statement.

- `avg_tmp_tables_per_query`

  The average number of internal temporary tables created per occurrence of the statement.

- `tmp_tables_to_disk_pct`

  The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- `first_seen`

  The time at which the statement was first seen.

- `last_seen`

  The time at which the statement was most recently seen.

- `digest`

  The statement digest.

26.4.3.41 The user_summary and x$user_summary Views

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

  The total number of statements for the user.

- `statement_latency`

  The total wait time of timed statements for the user.

- `statement_avg_latency`

  The average wait time per timed statement for the user.

- `table_scans`

  The total number of table scans for the user.

- `file_ios`

  The total number of file I/O events for the user.

- `file_io_latency`

  The total wait time of timed file I/O events for the user.

- `current_connections`

  The current number of connections for the user.

- `total_connections`

  The total number of connections for the user.

- `unique_hosts`

  The number of distinct hosts from which connections for the user have originated.

- `current_memory`

  The current amount of allocated memory for the user.

- `total_memory_allocated`

  The total amount of allocated memory for the user.

26.4.3.42 The user_summary_by_file_io and x$user_summary_by_file_io Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

  The total number of file I/O events for the user.

- `io_latency`

  The total wait time of timed file I/O events for the user.

26.4.3.43 The user_summary_by_file_io_type and x$user_summary_by_file_io_type Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

  The file I/O event name.

- `total`

  The total number of occurrences of the file I/O event for the user.

- `latency`

  The total wait time of timed occurrences of the file I/O event for the user.

- `max_latency`

  The maximum single wait time of timed occurrences of the file I/O event for the user.

26.4.3.44 The user_summary_by_stages and x$user_summary_by_stages Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

  The stage event name.

- `total`

  The total number of occurrences of the stage event for the user.

- `total_latency`

  The total wait time of timed occurrences of the stage event for the user.

- `avg_latency`

  The average wait time per timed occurrence of the stage event for the user.

26.4.3.45 The user_summary_by_statement_latency and x$user_summary_by_statement_latency Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

  The total number of statements for the user.

- `total_latency`

  The total wait time of timed statements for the user.

- `max_latency`

  The maximum single wait time of timed statements for the user.

- `lock_latency`

  The total time waiting for locks by timed statements for the user.

- `rows_sent`

  The total number of rows returned by statements for the user.

- `rows_examined`

  The total number of rows read from storage engines by statements for the user.

- `rows_affected`

  The total number of rows affected by statements for the user.

- `full_scans`

  The total number of full table scans by statements for the user.

26.4.3.46 The user_summary_by_statement_type and x$user_summary_by_statement_type Views

These views summarize informaion about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_statement_type` and `x$user_summary_by_statement_type` views have these columns:

- `user`

  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

  The final component of the statement event name.

- `total`

  The total number of occurrences of the statement event for the user.

- `total_latency`

  The total wait time of timed occurrences of the statement event for the user.

- `max_latency`

  The maximum single wait time of timed occurrences of the statement event for the user.

- `lock_latency`

  The total time waiting for locks by timed occurrences of the statement event for the user.

- `rows_sent`

  The total number of rows returned by occurrences of the statement event for the user.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the user.

- `rows_affected`

  The total number of rows affected by occurrences of the statement event for the user.

- `full_scans`

  The total number of full table scans by occurrences of the statement event for the user.

26.4.3.47 The version View

This view provides the current `sys` schema and MySQL server versions.

The `version` view has these columns:

- `sys_version`

  The `sys` schema version.

- `mysql_version`

  The MySQL server version.

26.4.3.48 The wait_classes_global_by_avg_latency and x$wait_classes_global_by_avg_latency Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` views have these columns:

- `event_class`

  The event class.

- `total`

  The total number of occurrences of events in the class.

- `total_latency`

  The total wait time of timed occurrences of events in the class.

- `min_latency`

  The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

  The average wait time per timed occurrence of events in the class.

- `max_latency`

  The maximum single wait time of timed occurrences of events in the class.

26.4.3.49 The wait_classes_global_by_latency and x$wait_classes_global_by_latency Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- `event_class`

  The event class.

- `total`

  The total number of occurrences of events in the class.

- `total_latency`

  The total wait time of timed occurrences of events in the class.

- `min_latency`

  The minimum single wait time of timed occurrences of events in the class.

- `avg_latency`

  The average wait time per timed occurrence of events in the class.

- `max_latency`

  The maximum single wait time of timed occurrences of events in the class.

26.4.3.50 The waits_by_host_by_latency and x$waits_by_host_by_latency Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- `host`

  The host from which the connection originated.

- `event`

  The event name.

- `total`

  The total number of occurrences of the event for the host.

- `total_latency`

  The total wait time of timed occurrences of the event for the host.

- `avg_latency`

  The average wait time per timed occurrence of the event for the host.

- `max_latency`

  The maximum single wait time of timed occurrences of the event for the host.

26.4.3.51 The waits_by_user_by_latency and x$waits_by_user_by_latency Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- `user`

  The user associated with the connection.

- `event`

  The event name.

- `total`

  The total number of occurrences of the event for the user.

- `total_latency`

  The total wait time of timed occurrences of the event for the user.

- `avg_latency`

  The average wait time per timed occurrence of the event for the user.

- `max_latency`

  The maximum single wait time of timed occurrences of the event for the user.

26.4.3.52 The waits_global_by_latency and x$waits_global_by_latency Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- `events`

  The event name.

- `total`

  The total number of occurrences of the event.

- `total_latency`

  The total wait time of timed occurrences of the event.

- `avg_latency`

  The average wait time per timed occurrence of the event.

- `max_latency`

  The maximum single wait time of timed occurrences of the event.

26.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

26.4.4.1 The create_synonym_db() Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

Parameters

- `in_db_name VARCHAR(64)`: The name of the schema for which to create the synonym.
- `in_synonym VARCHAR(64)`: The name to use for the synonym schema. This schema must not already exist.

Example

```
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| information_schema |
| mysql              |
| performance_schema |
| sys                |
| world              |
+--------------------+
mysql> CALL create_synonym_db('INFORMATION_SCHEMA', 'info');
+--------------------------------------+
| summary                              |
+--------------------------------------+
| Created 63 views in the info database |
+--------------------------------------+
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| information_schema |
| info               |
| mysql              |
| performance_schema |
| sys                |
| world              |
+--------------------+
mysql> SHOW FULL TABLES FROM info;
+---------------------------------------+------------+
| Tables_in_info                        | Table_type |
+---------------------------------------+------------+
| character_sets                        | VIEW       |
| collation_character_set_applicability | VIEW       |
| collations                            | VIEW       |
| column_privileges                     | VIEW       |
| columns                               | VIEW       |
...
```

26.4.4.2 The diagnostics() Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see Section 26.4.3.21, “The metrics View”)
- Information from other relevant `sys` schema views, such as the one that detemines queries in the 95th percentile

- Information from the `ndbinfo` schema, if the MySQL server is part of MySQL Cluster
- Replication status (both master and slave)

Some of the sys schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is `ON`.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.

Parameters

- `in_max_runtime INT UNSIGNED`: The maximum data collection time in seconds. Use `NULL` to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.
- `in_interval INT UNSIGNED`: The sleep time between data collections in seconds. Use `NULL` to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.
- `in_auto_config ENUM('current', 'medium', 'full')`: The Performance Schema configuration to use. Permitted values are:
  - `current`: Use the current instrument and consumer settings.
  - `medium`: Enable some instruments and consumers.
  - `full`: Enable all instruments and consumers.

Note

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the `medium` setting and especially the `full` setting, which has a large performance impact.

Use of the `medium` or `full` setting requires the `SUPER` privilege.

If a setting other than `current` is chosen, the current settings are restored at the end of the procedure.

Configuration Options

`diagnostics()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 26.4.2.1, “The sys_config Table”):

- `debug`, `@sys.debug`

  If this option is `ON`, produce debugging output. The default is `OFF`.

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

  If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure output includes the raw output from querying the `metrics` view. The default is `OFF`.

- `statement_truncate_len`, `@sys.statement_truncate_len`

  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```
mysql> CALL diagnostics(120, 30, 'current');
```

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee filename` and `notee` commands (see Section 4.5.1.2, “mysql Commands”):

```
mysql> tee diag.out;
mysql> CALL diagnostics(120, 30, 'current');
mysql> notee;
```

26.4.4.3 The execute_prepared_stmt() Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

Parameters

- `in_query LONGTEXT CHARACTER SET utf8`: The statement string to execute.

Configuration Options

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 26.4.2.1, “The sys_config Table”):

- `debug`, `@sys.debug`

  If this option is `ON`, produce debugging output. The default is `OFF`.

Example

```
mysql> CALL execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+----------+
| COUNT(*) |
+----------+
|       15 |
+----------+
```

26.4.4.4 The ps_setup_disable_background_threads() Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

Parameters

None.

Example

```
mysql> CALL ps_setup_disable_background_threads();
+-------------------------------+
| summary                       |
+-------------------------------+
| Disabled 24 background threads |
+-------------------------------+
```

26.4.4.5 The ps_setup_disable_consumer() Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

  A value of `''` matches all consumers.

Example

Disable all statement consumers:

```
mysql> CALL ps_setup_disable_consumer('statement');
+----------------------+
| summary              |
+----------------------+
| Disabled 4 consumers |
+----------------------+
```

26.4.4.6 The ps_setup_disable_instrument() Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

  A value of `''` matches all instruments.

Example

Disable a specific instrument:

```
mysql> CALL ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+----------------------+
| summary              |
+----------------------+
| Disabled 1 instrument |
+----------------------+
```

Disable all mutex instruments:

```
mysql> CALL ps_setup_disable_instrument('mutex');
+--------------------------+
| summary                  |
+--------------------------+
| Disabled 177 instruments |
```

```
+-------------------------+
```

26.4.4.7 The ps_setup_disable_thread() Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

Parameters

- `in_connection_id BIGINT`: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Example

Disable a specific connection by its connection ID:

```
mysql> CALL ps_setup_disable_thread(225);
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

Disable the current connection:

```
mysql> CALL ps_setup_disable_thread(CONNECTION_ID());
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

26.4.4.8 The ps_setup_enable_background_threads() Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

Parameters

None.

Example

```
mysql> CALL ps_setup_enable_background_threads();
+------------------------------+
| summary                      |
+------------------------------+
| Enabled 24 background threads |
+------------------------------+
```

26.4.4.9 The ps_setup_enable_consumer() Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

  A value of `''` matches all consumers.

Example

Enable all statement consumers:

```
mysql> CALL ps_setup_enable_consumer('statement');
+--------------------+
| summary            |
+--------------------+
| Enabled 4 consumers |
+--------------------+
```

26.4.4.10 The ps_setup_enable_instrument() Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

  A value of `''` matches all instruments.

Example

Enable a specific instrument:

```
mysql> CALL ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+---------------------+
| summary             |
+---------------------+
| Enabled 1 instrument |
+---------------------+
```

Enable all mutex instruments:

```
mysql> CALL ps_setup_enable_instrument('mutex');
+-------------------------+
| summary                 |
+-------------------------+
| Enabled 177 instruments |
+-------------------------+
```

26.4.4.11 The ps_setup_enable_thread() Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

Parameters

- `in_connection_id BIGINT`: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Example

Enable a specific connection by its connection ID:

```
mysql> CALL ps_setup_enable_thread(225);
+-----------------+
| summary         |
+-----------------+
```

```
| Enabled 1 thread |
+------------------+
```

Enable the current connection:

```
mysql> CALL ps_setup_enable_thread(CONNECTION_ID());
+------------------+
| summary          |
+------------------+
| Enabled 1 thread |
+------------------+
```

26.4.4.12 The ps_setup_reload_saved() Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Parameters

None.

26.4.4.13 The ps_setup_reset_to_default() Procedure

Resets the Performance Schema configuration to its default settings.

Parameters

- `in_verbose BOOLEAN`: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

Example

```
mysql> CALL ps_setup_reset_to_default(TRUE)\G
*************************** 1. row ***************************
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

*************************** 1. row ***************************
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')

...
```

26.4.4.14 The ps_setup_save() Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the *same* session as `ps_setup_save()` because the configuration is saved in `TEMPORARY` tables. `ps_setup_save()`

drops the temporary tables and releases the lock. If you end your session without invoking `ps_setup_save()`, the tables and lock disappear automatically.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Parameters

- `in_timeout INT`: How many seconds to wait to obtain the `sys.ps_setup_save` lock. A negative timeout value means infinite timeout.

Example

```
mysql> CALL ps_setup_save(10);

... make Performance Schema configuration changes ...

mysql> CALL ps_setup_reload_saved();
```

26.4.4.15 The ps_setup_show_disabled() Procedure

Displays all currently disabled Performance Schema configuration.

Parameters

- `in_show_instruments BOOLEAN`: Whether to display disabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display disabled threads.

Example

```
mysql> CALL ps_setup_show_disabled(TRUE, TRUE);
+----------------------------+
| performance_schema_enabled |
+----------------------------+
|                          1 |
+----------------------------+

+---------------+
| enabled_users |
+---------------+
| '%'@'%'       |
+---------------+

+-------------+---------------------+---------+-------+
| object_type | objects             | enabled | timed |
+-------------+---------------------+---------+-------+
| EVENT       | mysql.%             | NO      | NO    |
| EVENT       | performance_schema.% | NO      | NO    |
| EVENT       | information_schema.% | NO      | NO    |
| FUNCTION    | mysql.%             | NO      | NO    |
| FUNCTION    | performance_schema.% | NO      | NO    |
| FUNCTION    | information_schema.% | NO      | NO    |
| PROCEDURE   | mysql.%             | NO      | NO    |
| PROCEDURE   | performance_schema.% | NO      | NO    |
| PROCEDURE   | information_schema.% | NO      | NO    |
| TABLE       | mysql.%             | NO      | NO    |
| TABLE       | performance_schema.% | NO      | NO    |
| TABLE       | information_schema.% | NO      | NO    |
| TRIGGER     | mysql.%             | NO      | NO    |
| TRIGGER     | performance_schema.% | NO      | NO    |
| TRIGGER     | information_schema.% | NO      | NO    |
+-------------+---------------------+---------+-------+

...
```

26.4.4.16 The ps_setup_show_disabled_consumers() Procedure

Displays all currently disabled Performance Schema consumers.

Parameters

None.

Example

```
mysql> CALL ps_setup_show_disabled_consumers();
+---------------------------------+
| disabled_consumers              |
+---------------------------------+
| events_stages_current           |
| events_stages_history           |

+---------------------------------+
```

26.4.4.17 The ps_setup_show_disabled_instruments() Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

Parameters

None.

Example

```
mysql> CALL ps_setup_show_disabled_instruments()\G
*************************** 1. row ***************************
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
               timed: NO
*************************** 2. row ***************************
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
               timed: NO
*************************** 3. row ***************************
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
               timed: NO
...
```

26.4.4.18 The ps_setup_show_enabled() Procedure

Displays all currently enabled Performance Schema configuration.

Parameters

- `in_show_instruments BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display enabled threads.

Example

```
mysql> CALL ps_setup_show_enabled(FALSE, FALSE);
+---------------------------+
| performance_schema_enabled |
+---------------------------+
```

```
|                          1 |
+----------------------------+
1 row in set (0.00 sec)

+---------------+
| enabled_users |
+---------------+
| '%'@'%'       |
+---------------+

| thread_instrumentation     |
| statements_digest          |
+----------------------------+
```

26.4.4.19 The ps_setup_show_enabled_consumers() Procedure

Displays all currently enabled Performance Schema consumers.

Parameters

None.

Example

```
mysql> CALL ps_setup_show_enabled_consumers();
+----------------------------+
| enabled_consumers          |
+----------------------------+
| events_statements_current  |
| events_transactions_current |
| global_instrumentation     |
| thread_instrumentation     |
| statements_digest          |
+----------------------------+
```

26.4.4.20 The ps_setup_show_enabled_instruments() Procedure

Displays all currently enabled Performance Schema instruments. This might be a long list.

Parameters

None.

Example

```
mysql> CALL ps_setup_show_enabled_instruments()\G
*************************** 1. row ***************************
enabled_instruments: wait/io/file/sql/map
              timed: YES
*************************** 2. row ***************************
```

```
enabled_instruments: wait/io/file/sql/binlog
              timed: YES
*************************** 3. row ***************************
enabled_instruments: wait/io/file/sql/binlog_cache
              timed: YES
...
```

26.4.4.21 The ps_statement_avg_latency_histogram() Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

Parameters

None.

Example

The histogram output in statement units. For example, `* = 2 units` in the histogram legend means that each `*` character represents 2 statements.

```
mysql> CALL ps_statement_avg_latency_histogram()\G
*************************** 1. row ***************************
Performance Schema Statement Digest Average Latency Histogram:

  . = 1 unit
  * = 2 units
  # = 3 units

(0 - 66ms)     88  | ##############################
(66 - 133ms)   14  | ..............
(133 - 199ms)  4   | ....
(199 - 265ms)  5   | **
(265 - 332ms)  1   | .
(332 - 398ms)  0   |
(398 - 464ms)  1   | .
(464 - 531ms)  0   |
(531 - 597ms)  0   |
(597 - 663ms)  0   |
(663 - 730ms)  0   |
(730 - 796ms)  0   |
(796 - 863ms)  0   |
(863 - 929ms)  0   |
(929 - 995ms)  0   |
(995 - 1062ms) 0   |

  Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```

26.4.4.22 The ps_trace_statement_digest() Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` will fail due to parse errors.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Parameters

- `in_digest VARCHAR(32)`: The statement digest identifier to analyze.
- `in_runtime INT`: How long to run the analysis in seconds.
- `in_interval DECIMAL(2,2)`: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- `in_start_fresh BOOLEAN`: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.
- `in_auto_enable BOOLEAN`: Whether to automatically enable required consumers.

Example

```
mysql> CALL ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
+--------------------+

```

26.4.4.23 The ps_trace_thread() Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Parameters

- `in_thread_id INT`: The thread to trace.
- `in_outfile VARCHAR(255)`: The name to use for the `.dot` output file.
- `in_max_runtime DECIMAL(20,2)`: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- `in_interval DECIMAL(20,2)`: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- `in_start_fresh BOOLEAN`: Whether to reset all Performance Schema data before tracing.
- `in_auto_setup BOOLEAN`: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- `in_debug BOOLEAN`: Whether to include `file:lineno` information in the graph.

Example

```
mysql> CALL ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE,
+--------------------+
| summary            |

| summary          |
+------------------+
| Enabled 1 thread |
+------------------+
1 row in set (60.32 sec)
```

26.4.4.24 The ps_truncate_all_tables() Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

Parameters

- `in_verbose BOOLEAN`: Whether to display each `TRUNCATE TABLE` statement before executing it.

Example

```
mysql> CALL ps_truncate_all_tables(FALSE);
+---------------------+
| summary             |
+---------------------+
| Truncated 44 tables |
+---------------------+
```

26.4.4.25 The statement_performance_analyzer() Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure requires the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege because it manipulates the session `sql_log_bin` system variable to disable binary logging during its execution.

Parameters

- `in_action ENUM('snapshot', 'overall', 'delta', 'create_tmp', 'create_table', 'save', 'cleanup')`: The action to take. These values are permitted:
  - `snapshot`: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in_table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - `overall`: Generate an analysis based on the content of the table specified by `in_table`. For the overall analysis, `in_table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in_table` to use the existing snapshot. If `in_table` is `NULL` and no snapshot exists, a new snapshot is created. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.

  - `delta`: Generate a delta analysis. The delta is calculated between the reference table specified by `in_table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `create_tmp`: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - `save`: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
  - `cleanup`: Remove the temporary tables used for the snapshot and delta.

- `in_table VARCHAR(129)`: The table parameter used for some of the actions specified by the `in_action` parameter. Use the format *`db_name.tbl_name`* or *`tbl_name`* without using any backtick (`` ` ``) identifier-quoting characters. Periods (`.`) are not supported in database and table names.

  The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- `in_views SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting', 'with_temp_tables', 'custom')`: Which views to include. This parameter is a `SET` value, so it can contain multiple view names, separated by commas. The default is to include all views except `custom`. The following values are permitted:

  - `with_runtimes_in_95th_percentile`: Use the `statements_with_runtimes_in_95th_percentile` view.
  - `analysis`: Use the `statement_analysis` view.
  - `with_errors_or_warnings`: Use the `statements_with_errors_or_warnings` view.
  - `with_full_table_scans`: Use the `statements_with_full_table_scans` view.
  - `with_sorting`: Use the `statements_with_sorting` view.
  - `with_temp_tables`: Use the `statements_with_temp_tables` view.
  - `custom`: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

Configuration Options

`statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 26.4.2.1, “The sys_config Table”):

- `debug`, `@sys.debug`

  If this option is `ON`, produce debugging output. The default is `OFF`.

- `statement_performance_analyzer.limit`, `@sys.statement_performance_analyzer.limit`

  The maximum number of rows to return for views that have no built-in limit. The default is 100.

- `statement_performance_analyzer.view`, `@sys.statement_performance_analyzer.view`

  The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

Example

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```
mysql> CALL statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+----------------------------------------+
| Next Output                            |
+----------------------------------------+
| Queries with Runtime in 95th Percentile |
+----------------------------------------+
1 row in set (0.05 sec)

...

mysql> CALL statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_perc
+----------------------------------------+
| Next Output                            |
+----------------------------------------+
| Queries with Runtime in 95th Percentile |
+----------------------------------------+
1 row in set (0.03 sec)

...
```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```
mysql> CALL statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)

mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_full_tab
+---------------------------------------+
| Next Output                           |
+---------------------------------------+
| Queries with Runtime in 95th Percentile |
+---------------------------------------+
1 row in set (0.01 sec)

...

+-------------------------------------+
| Next Output                         |
+-------------------------------------+
| Top 10 Queries with Full Table Scan |
+-------------------------------------+
1 row in set (0.09 sec)

...
```

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```
mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
    -> SELECT sys.format_statement(DIGEST_TEXT) AS query,
    ->        SCHEMA_NAME AS db,
    ->        COUNT_STAR AS exec_count,
    ->        sys.format_time(SUM_TIMER_WAIT) AS total_latency,
    ->        sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
    ->        ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
    ->        ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
    ->        ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
    ->        DIGEST AS digest
    ->   FROM performance_schema.events_statements_summary_by_digest
    -> ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.01 sec)

mysql> CALL statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

shell> watch -n 60 "mysql sys --table -e \"
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> \""

Every 60.0s: mysql sys --table -e "        ...  Mon Dec 22 10:58:51 2014

+---------------------------------+
| Next Output                     |
+---------------------------------+
| Top 10 Queries Using Custom View |
+---------------------------------+
+------------------+-------+-----------+--------------+-------------+--------------+-------------------

+------------------+-------+-----------+--------------+-------------+--------------+-------------------
...
```

26.4.4.26 The table_exists() Procedure

Tests whether a given table exists as a regular table, a `TEMPORARY` table, or a view. The procedure returns the table type in an `OUT` parameter. If both a temporary and a permanent table exist with the given name, `TEMPORARY` is returned.

Parameters

- `in_db VARCHAR(64)`: The name of the database in which to check for table existance.
- `in_table VARCHAR(64)`: The name of the table to check the existance of.
- `out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')`: The return value. This is an `OUT` parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - `''`: The table name does not exist as a base table, `TEMPORARY` table, or view.
  - `BASE TABLE`: The table name exists as a base (permanent) table.
  - `VIEW`: The table name exists as a view.
  - `TEMPORARY`: The table name exists as a `TEMPORARY` table.

Example

```
mysql> CREATE DATABASE db1;
Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed
mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)

+-----------+
| @exists   |
+-----------+
| TEMPORARY |
+-----------+
1 row in set (0.00 sec)

26.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

26.4.5.1 The extract_schema_from_file_name() Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it will not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the schema name.

Return Value

A `VARCHAR(64)` value.

Example

```
mysql> SELECT extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----------------------------------------------------------------------+
| extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----------------------------------------------------------------------+
| world                                                                 |
+-----------------------------------------------------------------------+
```

26.4.5.2 The extract_table_from_file_name() Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the table name.

Return Value

A `VARCHAR(64)` value.

Example

```
mysql> SELECT extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----------------------------------------------------------------------+
| extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----------------------------------------------------------------------+
| City                                                                  |
```

```
+------------------------------------------------------------------+
```

26.4.5.3 The format_bytes() Function

Given a value in bytes, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `bytes`, `KiB` (kibibytes), `MiB` (mebibytes), `GiB` (gibibytes), `TiB` (tebibytes), or `PiB` (pebibytes).

Parameters

- `bytes TEXT`: The bytes value to format.

Return Value

A `TEXT` value.

Example

```
mysql> SELECT format_bytes(512), format_bytes(18446644073709551615);
+------------------+-----------------------------------+
| format_bytes(512) | format_bytes(18446644073709551615) |
+------------------+-----------------------------------+
| 512 bytes         | 16383.91 PiB                      |
+------------------+-----------------------------------+
```

26.4.5.4 The format_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

```
datadir
tmpdir
slave_load_tmpdir
innodb_data_home_dir
innodb_log_group_home_dir
innodb_undo_directory
basedir
```

A value that matches the value of system variable *`sysvar`* is replaced with the string `@@global.`*`sysvar`*.

Parameters

- `path VARCHAR(512)`: The path name to format.

Return Value

A `VARCHAR(512) CHARACTER SET utf8` value.

Example

```
mysql> SELECT format_path('/usr/local/mysql/data/world/City.ibd');
+-----------------------------------------------------+
| format_path('/usr/local/mysql/data/world/City.ibd') |
+-----------------------------------------------------+
| @@datadir/world/City.ibd                            |
+-----------------------------------------------------+
```

26.4.5.5 The format_statement() Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the

string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (`...`).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

Parameters

- `statement LONGTEXT`: The statement to format.

Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 26.4.2.1, "The sys_config Table"):

- `statement_truncate_len`, `@sys.statement_truncate_len`

  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Return Value

A `LONGTEXT` value.

Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT format_statement(@stmt);
+-------------------------------------------------------+
| format_statement(@stmt)                               |
+-------------------------------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-------------------------------------------------------+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT format_statement(@stmt);
+----------------------------------+
| format_statement(@stmt)          |
+----------------------------------+
| SELECT variabl ... ROM sys_config |
+----------------------------------+
```

26.4.5.6 The format_time() Function

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

Parameters

- `picoseconds TEXT`: The picoseconds value to format.

Return Value

A `TEXT` value.

Example

```
mysql> SELECT format_time(3501), format_time(188732396662000);
```

```
+------------------+-----------------------------+
| format_time(3501) | format_time(188732396662000) |
+------------------+-----------------------------+
| 3.50 ns          | 3.15 m                      |
+------------------+-----------------------------+
```

26.4.5.7 The list_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

Parameters

- `in_list TEXT`: The list to be modified.
- `in_add_value TEXT`: The value to add to the list.

Return Value

A `TEXT` value.

Example

```
mysql> SELECT @@sql_mode;
+----------------------------------------+
| @@sql_mode                             |
+----------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+----------------------------------------+
mysql> SET @@sql_mode = list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql> SELECT @@sql_mode;
+-----------------------------------------------------------------+
| @@sql_mode                                                      |
+-----------------------------------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----------------------------------------------------------------+
mysql> SET @@sql_mode = list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql> SELECT @@sql_mode;
+-----------------------------------------+
| @@sql_mode                              |
+-----------------------------------------+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----------------------------------------+
```

26.4.5.8 The list_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of `list_add()`

Parameters

- `in_list TEXT`: The list to be modified.
- `in_drop_value TEXT`: The value to drop from the list.

Return Value

A `TEXT` value.

26.4.5.9 The ps_is_account_enabled() Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given account is enabled.

Parameters

- `in_host VARCHAR(60)`: The host name of the account to check.
- `in_user VARCHAR(32)`: The user name of the account to check.

Return Value

An `ENUM('YES','NO')` value.

Example

```
mysql> SELECT ps_is_account_enabled('localhost', 'root');
+-----------------------------------------+
| ps_is_account_enabled('localhost', 'root') |
+-----------------------------------------+
| YES                                     |
+-----------------------------------------+
```

26.4.5.10 The ps_is_consumer_enabled() Function

Returns `YES` or `NO` to indicate whether a given Performance Schema consumer is enabled, or `NULL` if the argument is not a valid consumer name.

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see Section 25.4.7, “Pre-Filtering by Consumer”.

Parameters

- `in_consumer VARCHAR(64)`: The name of the consumer to check.

Return Value

An `ENUM('YES','NO')` value.

Example

```
mysql> SELECT ps_is_consumer_enabled('thread_instrumentation');
+-------------------------------------------------+
| ps_is_consumer_enabled('thread_instrumentation') |
+-------------------------------------------------+
| YES                                             |
+-------------------------------------------------+
```

26.4.5.11 The ps_is_instrument_default_enabled() Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is enabled by default.

Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

Return Value

An `ENUM('YES','NO')` value.

Example

```
mysql> SELECT ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-------------------------------------------------------------+
```

```
| ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
+---------------------------------------------------------------+
| NO                                                            |
+---------------------------------------------------------------+
mysql> SELECT ps_is_instrument_default_enabled('statement/sql/alter_user');
+---------------------------------------------------------------+
| ps_is_instrument_default_enabled('statement/sql/alter_user') |
+---------------------------------------------------------------+
| YES                                                           |
+---------------------------------------------------------------+
```

26.4.5.12 The ps_is_instrument_default_timed() Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is timed by default.

Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

Return Value

An `ENUM('YES','NO')` value.

Example

```
mysql> SELECT ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+---------------------------------------------------------------+
| ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+---------------------------------------------------------------+
| NO                                                            |
+---------------------------------------------------------------+
mysql> SELECT ps_is_instrument_default_timed('statement/sql/alter_user');
+---------------------------------------------------------------+
| ps_is_instrument_default_timed('statement/sql/alter_user') |
+---------------------------------------------------------------+
| YES                                                           |
+---------------------------------------------------------------+
```

26.4.5.13 The ps_is_thread_instrumented() Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given connection ID is enabled, `UNKNOWN` if the ID is unknown, or `NULL` if the ID is `NULL`.

Parameters

- `in_connection_id BIGINT UNSIGNED`: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Return Value

An `ENUM('YES','NO','UNKNOWN')` value.

Example

```
mysql> SELECT ps_is_thread_instrumented(43);
+-------------------------------+
| ps_is_thread_instrumented(43) |
+-------------------------------+
| UNKNOWN                       |
+-------------------------------+
mysql> SELECT ps_is_thread_instrumented(CONNECTION_ID());
+-----------------------------------------+
| ps_is_thread_instrumented(CONNECTION_ID()) |
```

```
+-------------------------------------------+
| YES                                       |
+-------------------------------------------+
```

26.4.5.14 The ps_thread_account() Function

Given a Performance Schema thread ID, returns the *`user_name@host_name`* account associated with the thread.

Parameters

- `in_thread_id BIGINT UNSIGNED`: The thread ID for which to return the account. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

Return Value

A `TEXT` value.

Example

```
mysql> SELECT ps_thread_account(ps_thread_id(CONNECTION_ID()));
+-------------------------------------------------+
| ps_thread_account(ps_thread_id(CONNECTION_ID())) |
+-------------------------------------------------+
| root@localhost                                  |
+-------------------------------------------------+
```

26.4.5.15 The ps_thread_id() Function

Returns the Performance Schema thread ID for a given connection ID, or the thread ID for the current connection if the connection ID is `NULL`.

Parameters

- `in_connection_id BIGINT UNSIGNED`: The ID of the connection for which to return the thread ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Return Value

A `BIGINT UNSIGNED` value.

Example

```
mysql> SELECT ps_thread_id(260);
+-------------------+
| ps_thread_id(260) |
+-------------------+
|               285 |
+-------------------+
```

26.4.5.16 The ps_thread_stack() Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

Parameters

- `in_thread_id BIGINT`: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose BOOLEAN`: Whether to include `file:lineno` information in the events.

Return Value

A `LONGTEXT CHARACTER SET latin1` value.

Example

```
mysql> SELECT ps_thread_stack(37, FALSE) AS thread_stack\G
*************************** 1. row ***************************
thread_stack: {"rankdir": "LR","nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "8.0.2-dmr-debug-log",
"mysql_user": "root@localhost","events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time:
...
```

26.4.5.17 The ps_thread_trx_info() Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

Parameters

- `in_thread_id BIGINT UNSIGNED`: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 26.4.2.1, “The sys_config Table”):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

  The maximum length of the output. The default is 65535.

Return Value

A `LONGTEXT` value.

Example

```
mysql> SELECT ps_thread_trx_info(48)\G
*************************** 1. row ***************************
ps_thread_trx_info(48): [
  {
    "time": "790.70 us",
    "state": "COMMITTED",
    "mode": "READ WRITE",
    "autocommitted": "NO",
    "gtid": "AUTOMATIC",
    "isolation": "REPEATABLE READ",
    "statements_executed": [
      {
        "sql_text": "INSERT INTO info VALUES (1, \'foo\')",
        "time": "471.02 us",
        "schema": "trx",
        "rows_examined": 0,
```

```
        "rows_affected": 1,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
      },
      {
        "sql_text": "COMMIT",
        "time": "254.42 us",
        "schema": "trx",
        "rows_examined": 0,
        "rows_affected": 0,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
      }
    ]
  },
  {
    "time": "426.20 us",
    "state": "COMMITTED",
    "mode": "READ WRITE",
    "autocommitted": "NO",
    "gtid": "AUTOMATIC",
    "isolation": "REPEATABLE READ",
    "statements_executed": [
      {
        "sql_text": "INSERT INTO info VALUES (2, \'bar\')",
        "time": "107.33 us",
        "schema": "trx",
        "rows_examined": 0,
        "rows_affected": 1,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
      },
      {
        "sql_text": "COMMIT",
        "time": "213.23 us",
        "schema": "trx",
        "rows_examined": 0,
        "rows_affected": 0,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
      }
    ]
  }
]
```

26.4.5.18 The quote_identifier() Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (`) characters.

Parameters

`in_identifier TEXT`: The identifier to quote.

Return Value

A `TEXT` value.

Example

```
mysql> SELECT quote_identifier('plain');
+--------------------------+
| quote_identifier('plain') |
+--------------------------+
| `plain`                  |
+--------------------------+
mysql> SELECT quote_identifier('trick`ier');
+-----------------------------+
| quote_identifier('trick`ier') |
+-----------------------------+
| `trick``ier`                |
+-----------------------------+
mysql> SELECT quote_identifier('integer');
+----------------------------+
| quote_identifier('integer') |
+----------------------------+
| `integer`                  |
+----------------------------+
```

26.4.5.19 The sys_get_config() Function

Given a configuration option name, returns the option value from the `sys_config` table, or the provided default value (which may be `NULL`) if the option does not exist in the table.

If `sys_get_config()` returns the default value and that value is `NULL`, it is expected that the caller is able to handle `NULL` for the given configuration option.

By convention, routines that call `sys_get_config()` first check whether the corresponding user-defined variable exists and is non-`NULL`. If so, the routine uses the variable value without reading the `sys_config` table. If the variable does not exist or is `NULL`, the routine reads the option value from the table and sets the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see Section 26.4.2.1, “The sys_config Table”.

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

Parameters

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.
- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

Return Value

A `VARCHAR(128)` value.

Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-------+
| Value |
+-------+
```

```
| 64    |
+-------+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```
mysql> SET @sys.statement_truncate_len =
    -> IFNULL(@sys.statement_truncate_len,
    ->        sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...) THEN ... END IF;` block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```
IF (@sys.statement_truncate_len IS NULL) THEN
  SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

26.4.5.20 The version_major() Function

This function returns the major version of the MySQL server.

Parameters

None.

Return Value

A `TINYINT UNSIGNED` value.

Example

```
mysql> SELECT VERSION(), version_major();
+---------------------+-----------------+
| VERSION()           | version_major() |
+---------------------+-----------------+
| 8.0.2-dmr-debug-log |               8 |
+---------------------+-----------------+
```

26.4.5.21 The version_minor() Function

This function returns the minor version of the MySQL server.

Parameters

None.

Return Value

A `TINYINT UNSIGNED` value.

Example

```
mysql> SELECT VERSION(), version_minor();
+---------------------+-----------------+
| VERSION()           | version_minor() |
+---------------------+-----------------+
| 8.0.2-dmr-debug-log |               0 |
+---------------------+-----------------+
```

26.4.5.22 The version_patch() Function

This function returns the patch release version of the MySQL server.

Parameters

None.

Return Value

A `TINYINT UNSIGNED` value.

Example

```
mysql> SELECT VERSION(), version_patch();
+---------------------+-----------------+
| VERSION()           | version_patch() |
+---------------------+-----------------+
| 8.0.2-dmr-debug-log |               2 |
+---------------------+-----------------+
```

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), Perl, Python, PHP, Ruby, and native C MySQL instances.

Note

Connector version numbers do not correlate with MySQL Server version numbers. See Table 27.2, “MySQL Connector Versions and MySQL Server Versions”.

MySQL Connectors

Oracle develops a number of connectors:

- Connector/C is a standalone replacement for the MySQL Client Library (`libmysqlclient`), to be used for C applications.
- Connector/C++ enables C++ applications to connect to MySQL.
- Connector/J provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- Connector/Net enables developers to create .NET applications that connect to MySQL. Connector/Net implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/Net can be written in any supported .NET language.

  MySQL for Visual Studio works with Connector/Net and Microsoft Visual Studio 2012, 2013, 2015, and 2017. MySQL for Visual Studio provides access to MySQL objects and data from Visual Studio. As a Visual Studio package, it integrates directly into Server Explorer providing the ability to create new connections and work with MySQL database objects.
- Connector/ODBC provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and OS X platforms.
- Connector/Python provides driver support for connecting to MySQL from Python applications using an API that is compliant with the Python DB API version 2.0. No additional Python modules or MySQL client libraries are required.

The MySQL C API

For direct access to using MySQL natively within a C application, the C API provides low-level access to the MySQL client/server protocol through the `libmysqlclient` client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions and in Connector/C distributions.

See also Section 27.7.1, “MySQL C API Implementations”.

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the C API is where to start. A number of programmer's utilities are available to help with the process; see Section 4.7, “MySQL Program Development Utilities”.

Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a *native driver*. The two solutions offer different benefits:

- Using *`libmysqlclient`* offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysqlclient` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between

components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

Table 27.1, “MySQL APIs and Interfaces” lists many of the libraries and interfaces available for MySQL. Table 27.2, “MySQL Connector Versions and MySQL Server Versions” shows which MySQL Server versions each connector supports.

Table 27.1 MySQL APIs and Interfaces

Environment	API	Type	Notes
Ada	GNU Ada MySQL Bindings	`libmysqlclient`	See MySQL Bindings for GNU Ada
C	C API	`libmysqlclient`	See Section 27.7, “MySQL C API”.
C	Connector/C	Replacement for `libmysqlclient`	See MySQL Connector/C Developer Guide.
C++	Connector/C++	`libmysqlclient`	See MySQL Connector/C++ Developer Guide.
	MySQL++	`libmysqlclient`	See MySQL++ Web site.
	MySQL wrapped	`libmysqlclient`	See MySQL wrapped.
Cocoa	MySQL-Cocoa	`libmysqlclient`	Compatible with the Objective-C Cocoa environment. See http://mysql-cocoa.sourceforge.net/
D	MySQL for D	`libmysqlclient`	See MySQL for D.
Eiffel	Eiffel MySQL	`libmysqlclient`	See Section 27.13, “MySQL Eiffel Wrapper”.
Erlang	`erlang-mysql-driver`	`libmysqlclient`	See `erlang-mysql-driver`.
Haskell	Haskell MySQL Bindings	Native Driver	See Brian O'Sullivan's pure Haskell MySQL bindings.
	`hsql-mysql`	`libmysqlclient`	See MySQL driver for Haskell .
Java/ JDBC	Connector/J	Native Driver	See MySQL Connector/J 5.1 Developer Guide.
Kaya	MyDB	`libmysqlclient`	See MyDB.
Lua	LuaSQL	`libmysqlclient`	See LuaSQL.
.NET/ Mono	Connector/Net	Native Driver	See MySQL Connector/Net Developer Guide.
Objective Caml	OBjective Caml MySQL Bindings	`libmysqlclient`	See MySQL Bindings for Objective Caml.
Octave	Database bindings for GNU Octave	`libmysqlclient`	See Database bindings for GNU Octave.
ODBC	Connector/ODBC	`libmysqlclient`	See MySQL Connector/ODBC Developer Guide.
Perl	`DBI`/`DBD::mysql`	`libmysqlclient`	See Section 27.9, “MySQL Perl API”.
	`Net::MySQL`	Native Driver	See `Net::MySQL` at CPAN
PHP	`mysql`, `ext/mysql` interface (deprecated)	`libmysqlclient`	See Original MySQL API.
	`mysqli`, `ext/mysqli` interface	`libmysqlclient`	See MySQL Improved Extension.
	`PDO_MYSQL`	`libmysqlclient`	See MySQL Functions (PDO_MYSQL).
	PDO mysqlnd	Native Driver	

Environment	API	Type	Notes
Python	Connector/Python	Native Driver	See MySQL Connector/Python Developer Guide.
Python	Connector/Python C Extension	`libmysqlclient`	See MySQL Connector/Python Developer Guide.
	MySQLdb	`libmysqlclient`	See Section 27.10, “MySQL Python API”.
Ruby	MySQL/Ruby	`libmysqlclient`	Uses `libmysqlclient`. See Section 27.11.1, “The MySQL/Ruby API”.
	Ruby/MySQL	Native Driver	See Section 27.11.2, “The Ruby/MySQL API”.
Scheme	`Myscsh`	`libmysqlclient`	See `Myscsh`.
SPL	`sql_mysql`	`libmysqlclient`	See `sql_mysql` for SPL.
Tcl	MySQLtcl	`libmysqlclient`	See Section 27.12, “MySQL Tcl API”.

Table 27.2 MySQL Connector Versions and MySQL Server Versions

Connector	Connector version	MySQL Server version
Connector/C	6.1.0 GA	5.6, 5.5, 5.1, 5.0, 4.1
Connector/C++	1.0.5 GA	5.6, 5.5, 5.1
Connector/J	5.1.8	5.6, 5.5, 5.1, 5.0, 4.1
Connector/Net	6.9.9 GA	5.7, 5.6, 5.5, 5.1, 5.0
Connector/Net	6.8.8 GA	5.7, 5.6, 5.5, 5.1, 5.0
Connector/ODBC	5.1	5.6, 5.5, 5.1, 5.0, 4.1.1+
Connector/ODBC	3.51 (Unicode not supported)	5.6, 5.5, 5.1, 5.0, 4.1
Connector/Python	2.0	5.7, 5.6, 5.5
Connector/Python	1.2	5.7, 5.6, 5.5

27.1 MySQL Connector/C

The MySQL Connector/C manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/C Developer Guide
- Release notes: MySQL Connector/C Release Notes

27.2 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/C++ Developer Guide
- Release notes: MySQL Connector/C++ Release Notes

27.3 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/J 5.1 Developer Guide
- Release notes: MySQL Connector/J Release Notes

27.4 MySQL Connector/Net

The MySQL Connector/Net manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/Net Developer Guide
- Release notes: MySQL Connector/Net Release Notes

27.5 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/ODBC Developer Guide
- Release notes: MySQL Connector/ODBC Release Notes

27.6 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/Python Developer Guide
- Release notes: MySQL Connector/Python Release Notes

27.7 MySQL C API

The C API provides low-level access to the MySQL client/server protocol and enables C programs to access database contents. The C API code is distributed with MySQL and implemented in the `libmysqlclient` library. See Section 27.7.1, “MySQL C API Implementations”.

Most other client APIs use the `libmysqlclient` library to communicate with the MySQL server. (Exceptions are Connector/J and Connector/Net.) This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs because they are referenced from the library. For a list of these variables, see Section 4.1, “Overview of MySQL Programs”.

For instructions on building client programs using the C API, see Section 27.7.4.1, “Building C API Client Programs”. For programming with threads, see Section 27.7.4.3, “Writing C API Threaded Client Programs”.

Note

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`). For additional compatibility information, see Section 27.7.4.4, “Running C API Client Programs”.

Clients have a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (16MB by default). Because buffer sizes are increased only as demand warrants, simply increasing the maximum limit does not in itself cause more resources to be used. This size check is mostly a precaution against erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each session's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The default maximum built into the client library is 1GB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter at server startup. See Section 5.1.1, “Configuring the Server”.

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

27.7.1 MySQL C API Implementations

The MySQL C API is a C-based API that client applications written in C can use to communicate with MySQL Server. Client programs refer to C API header files at compile time and link to a C API library file, `libmysqlclient`, at link time.

There are two ways to obtain the C API header and library files required to build C API client programs:

- Install a MySQL Server distribution.
- Install a Connector/C distribution.

For both MySQL Server and Connector/C, you can install a binary distribution that contains the C API files pre-built, or you can use a source distribution and build the C API files yourself.

Normally, you install either a MySQL Server distribution or a Connector/C distribution, but not both. For information about issues involved with simultaneous MySQL Server and Connector/C installations, see Section 27.7.2, “Simultaneous MySQL Server and Connector/C Installations”.

The names of the library files to use when linking C API client applications depend on the library type and platform for which a distribution is built:

- On Unix (and Unix-like) sytems, the static library is `libmysqlclient.a`. The dynamic library is `libmysqlclient.so` on most Unix systems and `libmysqlclient.dylib` on OS X.
- On Windows, the static library is `mysqlclient.lib` and the dynamic library is `libmysql.dll`. Windows distributions also include `libmysql.lib`, a static import library needed for using the dynamic library.

  Windows distributions also include a set of debug libraries. These have the same names as the nondebug libraries, but are located in the `lib/debug` library. You must use the debug libraries when compiling clients built using the debug C runtime.

On Unix, you may also see libraries that include `_r` in the names. Before MySQL 5.5, these were built as thread-safe (re-entrant) libraries separately from the non-`_r` libraries. As of 5.5, both libraries are the same and the `_r` names are symbolic links to the corresponding non-`_r` names. There is no need to use the `_r` libraries. For example, if you use `mysql_config` to obtain linker flags, you can use `mysql_config --libs` in all cases, even for threaded clients. There is no need to use `mysql_config --libs_r`.

27.7.2 Simultaneous MySQL Server and Connector/C Installations

MySQL Server and Connector/C installation packages both provide the files needed to build and run MySQL C API client programs. This section discusses when it is possible to install both products on the

same system. For some packaging formats, this is possible without conflict. For others, both products cannot be installed at the same time.

This discussion assumes the use of similar package types for both products (for example, RPM packages for both products). It does not try to describe coexistence between packaging types (for example, use of RPM packages for one product and a `tar` file package for the other). Nor does it describe coexistence of packages provided by Oracle and those provided by third-party vendors.

If you install both products, it may be necessary to adjust your development tools or runtime environment to choose one set of header files and libraries over the other. See Section 27.7.4.1, "Building C API Client Programs", and Section 27.7.4.4, "Running C API Client Programs".

`tar` and Zip file packages install under the directory into which you unpack them. For example, you can unpack MySQL Server and Connector/C `tar` packages under `/usr/local` and they will unpack into distinct directory names without conflict.

Windows MSI installers use their own installation directory, so MySQL Server and Connector/C installers do not conflict.

OS X DMG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/usr/local/mysql-5.6.11-osx10.7-x86_64/
/usr/local/mysql-connector-c-6.1.0-osx10.7-x86/
```

Solaris PKG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/opt/mysql/mysql
/opt/mysql/connector-c
```

The Solaris Connector/C installer does not create any symlinks from system directories such as `/usr/bin` or `/usr/lib` into the installation directory. That must be done manually if desired after installation.

For RPM installations, there are several types of RPM packages. MySQL Server `shared` and `devel` RPM packages are similar to the corresponding Connector/C RPM packages. These RPM package types cannot coexist because the MySQL Server and Connector/C RPM packages use the same installation locations for the client library-related files. This means the following conditions hold:

- If MySQL Server `shared` and `devel` RPM packages are installed, they provide the C API headers and libraries, and there is no need to install the Connector/C RPM packages. To install the Connector/C packages anyway, you must first remove the corresponding MySQL Server packages.
- To install MySQL Server RPM packages if you already have Connector/C RPM packages installed, you must first remove the Connector/C RPM packages.

MySQL Server RPM packages other than `shared` and `devel` do not conflict with Connector/C packages and can be installed if Connector/C is installed. This includes the main server RPM that includes the `mysqld` server itself.

27.7.3 Example C API Client Programs

Many of the clients in MySQL source distributions are written in C, such as `mysql`, `mysqladmin`, and `mysqlshow`. If you are looking for examples that demonstrate how to use the C API, take a look at these clients: Obtain a source distribution and look in its `client` directory. See Section 2.1.2, "How to Get MySQL".

27.7.4 Building and Running C API Client Programs

The following sections provide information on building client programs that use the C API. Topics include compiling and linking clients, writing threaded clients, and troubleshooting runtime problems.

27.7.4.1 Building C API Client Programs

This section provides guidelines for compiling C programs that use the MySQL C API.

Compiling MySQL Clients on Unix

The examples here use `gcc` as the compiler. A different compiler might be appropriate on some systems (for example, `clang` on OS X or FreeBSD, or Sun Studio on Solaris). Adjust the examples as necessary.

You may need to specify an `-I` option when you compile client programs that use MySQL header files, so that the compiler can find them. For example, if the header files are installed in `/usr/local/mysql/include`, use this option in the compile command:

```
-I/usr/local/mysql/include
```

MySQL clients must be linked using the `-lmysqlclient` option in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use these options in the link command:

```
-L/usr/local/mysql/lib -lmysqlclient
```

The path names may differ on your system. Adjust the `-I` and `-L` options as necessary.

To make it simpler to compile MySQL programs on Unix, use the `mysql_config` script. See Section 4.7.1, "`mysql_config` — Display Options for Compiling Clients".

`mysql_config` displays the options needed for compiling or linking:

```
shell> mysql_config --cflags
shell> mysql_config --libs
```

You can run those commands to get the proper options and add them manually to compilation or link commands. Alternatively, include the output from `mysql_config` directly within command lines using backticks:

```
shell> gcc -c `mysql_config --cflags` progname.c
shell> gcc -o progname progname.o `mysql_config --libs`
```

On Unix, linking uses dynamic libraries by default. To link to the static client library instead, add its path name to the link command. For example, if the library is located in `/usr/local/mysql/lib`, link like this:

```
shell> gcc -o progname progname.o /usr/local/mysql/lib/libmysqlclient.a
```

Or use `mysql_config` to provide the library name:

```
shell> gcc -o progname progname.o `mysql_config --variable=pkglibdir`/libmysqlclient.a
```

`mysql_config` does not currently provide a way to list all libraries needed for static linking, so it might be necessary to name additional libraries on the link command (for example, `-lnsl -lsocket` on Solaris). To get an idea which libraries to add, use `mysql_config --libs` and `ldd libmysqlclient.so` (or `otool -L libmysqlclient.dylib` on OS X).

`pkg-config` can be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient

mysql_config --libs
pkg-config --libs mysqlclient
```

To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

For more information, see Section 27.7.4.2, “Building C API Client Programs Using pkg-config”.

Compiling MySQL Clients on Microsoft Windows

To specify header and library file locations, use the facilities provided by your development environment.

To build C API clients on Windows, you must link in the C client library, as well as the Windows ws2_32 sockets library and Secur32 security library.

You link your code with either the dynamic or static C client library. On Windows, the static library is named `mysqlclient.lib` and the dynamic library is named `libmysql.dll`. In addition, the `libmysql.lib` static import library is needed for using the dynamic library. If the static C client library is used, the client application must be compiled with the same version of Visual Studio used to compile the C client library (which is Visual Studio 2015 for the static C client library built by Oracle).

Note

The MySQL Connector/C is a standalone, drop-in replacement of the MySQL C client libraries that come with the MySQL server distribution. The Oracle-built MySQL Connector/C contains currently two versions of the static client library, one built with Visual Studio 2013 and the other one with Visual Studio 2015; use the one that matches the Visual Studio version you use to compile your application.

When using the Oracle-built MySQL C client library (or MySQL Connector/C), following these rules when it comes to linking the C runtime for your client application:

- For the Community version of the MySQL C client library (or the Community version of MySQL Connector/C):
  - *For version 8.0.0* (or MySQL Connector/C Community 6.1.9 and before):
    - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
    - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).
  - *For version 8.0.1 and later* (or MySQL Connector/C Community 6.1.10 and later): Always link dynamically to the C runtime (use the `/MD` compiler option), whether you are linking to the static or dynamic C client library. Also, target hosts running the client application need to have the Visual C++ Redistributable for Visual Studio 2015 installed.
- For the Commercial version of the MySQL C client library (or the Commercial version of MySQL Connector/C):
  - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
  - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).

In general, when linking to a static MySQL C client library, the client library and the client application must use the same compiler option when it comes to linking the C runtime—that is, if your C client library is compiled with the `/MT` option, your client application should also be compiled with the `/MT` option, and so on (see the MSDN page describing the C library linking options for more details). Follow this rule when you are building your own static MySQL C client library (or MySQL Connector/C) from source and linking you client application to it.

Note

Debug Mode: Because of the above-mentioned rule, you cannot build your application in debug mode (with the `/MTd` or `/MDd` compiler option) and link it to the static C client library built by Oracle, which is *not* built with the debug options; instead, you will have to build the static client library from source with the debug options.

Troubleshooting Problems Linking to the MySQL Client Library

The MySQL client library includes SSL support built in. It is unnecessary to specify either `-lssl` or `-lcrypto` at link time. Doing so may in fact result in problems at runtime.

If the linker cannot find the MySQL client library, you might get undefined-reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-L`*`dir_path`* `-lmysqlclient` at the end of your link command, where *`dir_path`* represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well. You can include `mysql_config` output directly in your compile or link command using backticks. For example:

```
shell> gcc -o progname progname.o `mysql_config --libs`
```

If an error occurs at link time that the `floor` symbol is undefined, link to the math library by adding `-lm` to the end of the compile/link line. Similarly, if you get undefined-reference errors for other functions that should exist on your system, such as `connect()`, check the manual page for the function in question to determine which libraries you should add to the link command.

If you get undefined-reference errors such as the following for functions that do not exist on your system, it usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

In this case, you should download the latest MySQL or Connector/C source distribution and compile the MySQL client library yourself. See Section 2.8, “Installing MySQL from Source”, and MySQL Connector/C Developer Guide.

27.7.4.2 Building C API Client Programs Using pkg-config

MySQL distributions contain a `mysqlclient.pc` file that provides information about MySQL configuration for use by the `pkg-config` command. This enables `pkg-config` to be used as an

alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient

mysql_config --libs
pkg-config --libs mysqlclient
```

The last `pkg-config` command produces flags for dynamic linking. To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

On some platforms, the output with and without `--static` might be the same.

Note

If `pkg-config` does not find MySQL information, it might be necessary to set the `PKG_CONFIG_PATH` environment variable to the directory in which the `mysqlclient.pc` file is located, which by default is usually the `pkgconfig` directory under the MySQL library directory. For example (adjust the location appropriately):

```
export PKG_CONFIG_PATH=/usr/local/mysql/lib/pkgconfig # sh, bash, ...
setenv PKG_CONFIG_PATH /usr/local/mysql/lib/pkgconfig # csh, tcsh, ...
```

The `mysqlconfig.pc` installation location can be controlled using the `INSTALL_PKGCONFIGDIR CMake` option. See Section 2.8.4, “MySQL Source-Configuration Options”.

The `--variable` option takes a configuration variable name and displays the variable value:

```
pkg-config --variable=prefix mysqlclient     # installation prefix directory
pkg-config --variable=includedir mysqlclient # header file directory
pkg-config --variable=libdir mysqlclient     # library directory
```

To see which variable values `pkg-config` can display using the `--variable` option, use this command:

```
pkg-config --print-variables mysqlclient
```

You can use `pkg-config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `pkg-config` as follows:

```
gcc -c `pkg-config --cflags mysqlclient` progname.c
gcc -o progname progname.o `pkg-config --libs mysqlclient`
```

27.7.4.3 Writing C API Threaded Client Programs

The client library is almost thread-safe. The biggest problem is that the subroutines in `sql/net_serv.cc` that read from sockets are not interrupt-safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. To use your own `SIGPIPE` handler, first call `mysql_library_init()`, then install your handler.

If “undefined symbol” errors occur when linking against the `libmysqlclient` client library, in most cases this is because you have not included the thread libraries on the link/compile command.

The client library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Multiple threads cannot send a query to the MySQL server at the same time on the same connection. In particular, you must ensure that between calls to `mysql_query()` and `mysql_store_result()` in one thread, no other thread uses the same connection. You must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. After `mysql_store_result()` returns, the lock can be released and other threads may query the same connection.

  If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

- Many threads can access different result sets that are retrieved with `mysql_store_result()`.

- To use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.

You need to know the following if you have a thread that did not create the connection to the MySQL database but is calling MySQL functions:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To avoid problems, you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.

2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, it will call `mysql_thread_init()` for you.

3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

27.7.4.4 Running C API Client Programs

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`).

The major client library version determines compatibility. (For example, for `libmysqlclient.so.18.1.0`, the major version is 18.) For this reason, the libraries shipped with newer versions of MySQL are drop-in replacements for older versions that have the same major number. As long as the major library version is the same, you can upgrade the library and old applications should continue to work with it.

Undefined-reference errors might occur at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `libmysqlclient` library cannot be found, it means that your system cannot find the shared `libmysqlclient.so` library. The solution

to this problem is to tell your system to search for shared libraries in the directory where that library is located. Use whichever of the following methods is appropriate for your system:

- Add the path of the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` or `LD_LIBRARY` environment variable.
- On OS X, add the path of the directory where `libmysqlclient.dylib` is located to the `DYLD_LIBRARY_PATH` environment variable.
- Copy the shared-library files (such as `libmysqlclient.so`) to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`. Be sure to copy all related files. A shared library might exist under several names, using symlinks to provide the alternate names.

27.7.4.5 C API Server and Client Library Versions

The string and numeric forms of the MySQL server version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_server_info()` and `mysql_get_server_version()` functions.

The MySQL client library version depends on the type of distribution that provides the library:

- For MySQL distributions, the client library version is the MySQL version. The string and numeric forms of this version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

  The `LIBMYSQL_VERSION` and `LIBMYSQL_VERSION_ID` macros have the same values as `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` and the two sets of macros can be used interchangeably.

- For Connector/C distributions, the client library version is the Connector/C version. The string and numeric forms of this version are available at compile time as the values of the `LIBMYSQL_VERSION` and `LIBMYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

  The `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros indicate the string and numeric forms of the MySQL version on which the Connector/C distribution is based.

27.7.5 C API Data Structures

This section describes C API data structures other than those used for prepared statements or the replication stream interface. For information about those, see Section 27.7.9, “C API Prepared Statement Data Structures”, and Section 27.7.15, “C API Binary Log Data Structures”.

- `MYSQL`

  This structure represents handler for one database connection. It is used for almost all MySQL functions. Do not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- `MYSQL_RES`

  This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- `MYSQL_ROW`

  This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain

binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- `MYSQL_FIELD`

  This structure contains metadata: information about a field, such as the field's name, type, and size. Its members are described in more detail later in this section. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- `MYSQL_FIELD_OFFSET`

  This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- `my_ulonglong`

  The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of `0` to `1.84e19`.

  Some functions that return a row count using this type return -1 as an unsigned value to indicate an error or exceptional condition. You can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

  On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
        (unsigned long) mysql_num_rows(result));
```

- `my_bool`

  A boolean type, for values that are true (nonzero) or false (zero). The `my_bool` type was used before MySQL 8.0. As of MySQL 8.0, use the `bool` or `int` C type instead.

The `MYSQL_FIELD` structure contains the members described in the following list. The definitions apply primarily for columns of result sets such as those produced by `SELECT` statements. `MYSQL_FIELD` structures are also used to provide metadata for `OUT` and `INOUT` parameters returned from stored procedures executed using prepared `CALL` statements. For such parameters, some of the structure members have a meaning different from the meaning for column values.

- `char * name`

  The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias. For a procedure parameter, the parameter name.

- `char * org_name`

  The name of the field, as a null-terminated string. Aliases are ignored. For expressions, the value is an empty string. For a procedure parameter, the parameter name.

- `char * table`

  The name of the table containing this field, if it is not a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

- `char * org_table`

  The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the view. If the column is selected from a derived table, `org_table`

names the base table. If a derived table wraps a view, `org_table` still names the base table. If the column is an expression, `org_table` is the empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the value is the procedure name.

- `char * db`

  The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the name of the database containing the procedure.

- `char * catalog`

  The catalog name. This value is always `"def"`.

- `char * def`

  The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`

  The width of the field. This corresponds to the display length, in bytes.

  The server determines the `length` value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

- `unsigned long max_length`

  The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

  The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the "widest" value is `-12.345`, `max_length` is 7 (the length of `'-12.345'`).

  If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See Section 27.7.9, "C API Prepared Statement Data Structures".) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See Section 27.7.11.3, "mysql_stmt_attr_set()", and Section 27.7.11.28, "mysql_stmt_store_result()".)

- `unsigned int name_length`

  The length of `name`.

- `unsigned int org_name_length`

  The length of `org_name`.

- `unsigned int table_length`

  The length of `table`.

- `unsigned int org_table_length`

  The length of `org_table`.

- `unsigned int db_length`

The length of `db`.

- `unsigned int catalog_length`

  The length of `catalog`.

- `unsigned int def_length`

  The length of `def`.

- `unsigned int flags`

  Bit-flags that describe the field. The `flags` value may have zero or more of the bits set that are shown in the following table.

Flag Value	Flag Description
`NOT_NULL_FLAG`	Field cannot be `NULL`
`PRI_KEY_FLAG`	Field is part of a primary key
`UNIQUE_KEY_FLAG`	Field is part of a unique key
`MULTIPLE_KEY_FLAG`	Field is part of a nonunique key
`UNSIGNED_FLAG`	Field has the `UNSIGNED` attribute
`ZEROFILL_FLAG`	Field has the `ZEROFILL` attribute
`BINARY_FLAG`	Field has the `BINARY` attribute
`AUTO_INCREMENT_FLAG`	Field has the `AUTO_INCREMENT` attribute
`ENUM_FLAG`	Field is an `ENUM`
`SET_FLAG`	Field is a `SET`
`BLOB_FLAG`	Field is a `BLOB` or `TEXT` (deprecated)
`TIMESTAMP_FLAG`	Field is a `TIMESTAMP` (deprecated)
`NUM_FLAG`	Field is numeric; see additional notes following table
`NO_DEFAULT_VALUE_FLAG`	Field has no default value; see additional notes following table

Some of these flags indicate data type information and are superseded by or used in conjunction with the `MYSQL_TYPE_`*`xxx`* value in the `field->type` member described later:

- To check for `BLOB` or `TIMESTAMP` values, check whether `type` is `MYSQL_TYPE_BLOB` or `MYSQL_TYPE_TIMESTAMP`. (The `BLOB_FLAG` and `TIMESTAMP_FLAG` flags are unneeded.)
- `ENUM` and `SET` values are returned as strings. For these, check that the `type` value is `MYSQL_TYPE_STRING` and that the `ENUM_FLAG` or `SET_FLAG` flag is set in the `flags` value.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_NEWDECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no `DEFAULT` clause in its definition. This does not apply to `NULL` columns (because such columns have a default of `NULL`), or to `AUTO_INCREMENT` columns (which have an implied default value).

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field cannot be null\n");
```

You may use the convenience macros shown in the following table to determine the boolean status of the `flags` value.

Flag Status	Description
`IS_NOT_NULL(flags)`	True if this field is defined as `NOT NULL`
`IS_PRI_KEY(flags)`	True if this field is a primary key
`IS_BLOB(flags)`	True if this field is a `BLOB` or `TEXT` (deprecated; test `field->type` instead)

- `unsigned int decimals`

  The number of decimals for numeric fields, and the fractional seconds precision for temporal fields.

- `unsigned int charsetnr`

  An ID number that indicates the character set/collation pair for the field.

  Normally, character values in result sets are converted to the character set indicated by the `character_set_results` system variable. In this case, `charsetnr` corresponds to the character set indicated by that variable. Character set conversion can be suppressed by setting `character_set_results` to `NULL`. In this case, `charsetnr` corresponds to the character set of the original table column or expression. See also Section 10.1.4, “Connection Character Sets and Collations”.

  To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

  `charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+----------+---------+----+---------+----------+---------+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+----------+---------+----+---------+----------+---------+
| binary    | binary  | 63 | Yes     | Yes      |       1 |
+----------+---------+----+---------+----------+---------+

mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
    -> FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+----------------+--------------------+
| COLLATION_NAME  | CHARACTER_SET_NAME |
+----------------+--------------------+
| utf8_general_ci | utf8               |
+----------------+--------------------+
```

- `enum enum_field_types type`

  The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
`MYSQL_TYPE_TINY`	`TINYINT` field
`MYSQL_TYPE_SHORT`	`SMALLINT` field
`MYSQL_TYPE_LONG`	`INTEGER` field
`MYSQL_TYPE_INT24`	`MEDIUMINT` field

Type Value	Type Description
MYSQL_TYPE_LONGLONG	BIGINT field
MYSQL_TYPE_DECIMAL	DECIMAL or NUMERIC field
MYSQL_TYPE_NEWDECIMAL	Precision math DECIMAL or NUMERIC
MYSQL_TYPE_FLOAT	FLOAT field
MYSQL_TYPE_DOUBLE	DOUBLE or REAL field
MYSQL_TYPE_BIT	BIT field
MYSQL_TYPE_TIMESTAMP	TIMESTAMP field
MYSQL_TYPE_DATE	DATE field
MYSQL_TYPE_TIME	TIME field
MYSQL_TYPE_DATETIME	DATETIME field
MYSQL_TYPE_YEAR	YEAR field
MYSQL_TYPE_STRING	CHAR or BINARY field
MYSQL_TYPE_VAR_STRING	VARCHAR or VARBINARY field
MYSQL_TYPE_BLOB	BLOB or TEXT field (use max_length to determine the maximum length)
MYSQL_TYPE_SET	SET field
MYSQL_TYPE_ENUM	ENUM field
MYSQL_TYPE_GEOMETRY	Spatial field
MYSQL_TYPE_NULL	NULL-type field

The MYSQL_TYPE_TIME2, MYSQL_TYPE_DATETIME2, and MYSQL_TYPE_TIMESTAMP2) type codes are used only on the server side. Clients see the MYSQL_TYPE_TIME, MYSQL_TYPE_DATETIME, and MYSQL_TYPE_TIMESTAMP codes.

You can use the IS_NUM() macro to test whether a field has a numeric type. Pass the type value to IS_NUM() and it evaluates to TRUE if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

ENUM and SET values are returned as strings. For these, check that the type value is MYSQL_TYPE_STRING and that the ENUM_FLAG or SET_FLAG flag is set in the flags value.

27.7.6 C API Function Overview

The following table summarizes the functions available in the C API. For greater detail, see the descriptions in Section 27.7.7, “C API Function Descriptions”.

Table 27.3 C API Function Names and Descriptions

Function	Description
my_init()	Initialize global variables, and thread handler in thread-safe programs
mysql_affected_rows()	Returns the number of rows changed/deleted/inserted by the last UPDATE, DELETE, or INSERT query
mysql_autocommit()	Toggles autocommit mode on/off
mysql_change_user()	Changes user and database on an open connection
mysql_character_set_name()	Return default character set name for current connection
mysql_client_find_plugin()	Return pointer to plugin

Function	Description
mysql_client_register_plugin()	Register a plugin
mysql_close()	Closes a server connection
mysql_commit()	Commits the transaction
mysql_connect()	Connects to a MySQL server (this function is deprecated; use mysql_real_connect() instead)
mysql_create_db()	Creates a database (this function is deprecated; use the SQL statement CREATE DATABASE instead)
mysql_data_seek()	Seeks to an arbitrary row number in a query result set
mysql_debug()	Does a DBUG_PUSH with the given string
mysql_drop_db()	Drops a database (this function is deprecated; use the SQL statement DROP DATABASE instead)
mysql_dump_debug_info()	Makes the server write debug information to the log
mysql_eof()	Determines whether the last row of a result set has been read (this function is deprecated; mysql_errno() or mysql_error() may be used instead)
mysql_errno()	Returns the error number for the most recently invoked MySQL function
mysql_error()	Returns the error message for the most recently invoked MySQL function
mysql_escape_string()	Escapes special characters in a string for use in an SQL statement
mysql_fetch_field()	Returns the type of the next table field
mysql_fetch_field_direct()	Returns the type of a table field, given a field number
mysql_fetch_fields()	Returns an array of all field structures
mysql_fetch_lengths()	Returns the lengths of all columns in the current row
mysql_fetch_row()	Fetches the next row from the result set
mysql_field_count()	Returns the number of result columns for the most recent statement
mysql_field_seek()	Puts the column cursor on a specified column
mysql_field_tell()	Returns the position of the field cursor used for the last mysql_fetch_field()
mysql_free_result()	Frees memory used by a result set
mysql_get_character_set_info()	Return information about default character set
mysql_get_client_info()	Returns client version information as a string
mysql_get_client_version()	Returns client version information as an integer
mysql_get_host_info()	Returns a string describing the connection
mysql_get_option()	Returns the value of a mysql_options() option
mysql_get_proto_info()	Returns the protocol version used by the connection
mysql_get_server_info()	Returns the server version number
mysql_get_server_version()	Returns version number of server as an integer
mysql_get_ssl_cipher()	Return current SSL cipher
mysql_hex_string()	Encode string in hexadecimal format
mysql_info()	Returns information about the most recently executed query
mysql_init()	Gets or initializes a MYSQL structure

Function	Description
mysql_insert_id()	Returns the ID generated for an AUTO_INCREMENT column by the previous query
mysql_kill()	Kills a given thread
mysql_library_end()	Finalize the MySQL C API library
mysql_library_init()	Initialize the MySQL C API library
mysql_list_dbs()	Returns database names matching a simple regular expression
mysql_list_fields()	Returns field names matching a simple regular expression
mysql_list_processes()	Returns a list of the current server threads
mysql_list_tables()	Returns table names matching a simple regular expression
mysql_load_plugin()	Load a plugin
mysql_load_plugin_v()	Load a plugin
mysql_more_results()	Checks whether any more results exist
mysql_next_result()	Returns/initiates the next result in multiple-result executions
mysql_num_fields()	Returns the number of columns in a result set
mysql_num_rows()	Returns the number of rows in a result set
mysql_options()	Sets connect options for mysql_real_connect()
mysql_options4()	Sets connect options for mysql_real_connect()
mysql_ping()	Checks whether the connection to the server is working, reconnecting as necessary
mysql_plugin_options()	Set a plugin option
mysql_query()	Executes an SQL query specified as a null-terminated string
mysql_real_connect()	Connects to a MySQL server
mysql_real_escape_string()	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
mysql_real_escape_string_quote()	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection and the quoting context
mysql_real_query()	Executes an SQL query specified as a counted string
mysql_refresh()	Flush or reset tables and caches
mysql_reload()	Tells the server to reload the grant tables
mysql_reset_connection()	Reset connection to clear session state
mysql_result_metadata()	Whether a result set has metadata
mysql_rollback()	Rolls back the transaction
mysql_row_seek()	Seeks to a row offset in a result set, using value returned from mysql_row_tell()
mysql_row_tell()	Returns the row cursor position
mysql_select_db()	Selects a database
mysql_server_end()	Finalize the MySQL C API library
mysql_server_init()	Initialize the MySQL C API library
mysql_session_track_get_first()	Get first part of session state-change information
mysql_session_track_get_next()	Get next part of session state-change information
mysql_set_character_set()	Set default character set for current connection

Function	Description
mysql_set_local_infile_default()	Set the LOAD DATA LOCAL INFILE handler callbacks to their default values
mysql_set_local_infile_handler()	Install application-specific LOAD DATA LOCAL INFILE handler callbacks
mysql_set_server_option()	Sets an option for the connection (like multi-statements)
mysql_sqlstate()	Returns the SQLSTATE error code for the last error
mysql_shutdown()	Shuts down the database server
mysql_ssl_set()	Prepare to establish SSL connection to server
mysql_stat()	Returns the server status as a string
mysql_store_result()	Retrieves a complete result set to the client
mysql_thread_end()	Finalize thread handler
mysql_thread_id()	Returns the current thread ID
mysql_thread_init()	Initialize thread handler
mysql_thread_safe()	Returns 1 if the clients are compiled as thread-safe
mysql_use_result()	Initiates a row-by-row result set retrieval
mysql_warning_count()	Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling mysql_library_init().
2. Initialize a connection handler by calling mysql_init() and connect to the server by calling mysql_real_connect().
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling mysql_close().
5. End use of the MySQL library by calling mysql_library_end().

The purpose of calling mysql_library_init() and mysql_library_end() is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you do not call mysql_library_end(), a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

In a nonmulti-threaded environment, the call to mysql_library_init() may be omitted, because mysql_init() will invoke it automatically as necessary. However, mysql_library_init() is not thread-safe in a multi-threaded environment, and thus neither is mysql_init(), which calls mysql_library_init(). You must either call mysql_library_init() prior to spawning any threads, or else use a mutex to protect the call, whether you invoke mysql_library_init() or indirectly through mysql_init(). This should be done prior to any other client library call.

To connect to the server, call mysql_init() to initialize a connection handler, then call mysql_real_connect() with that handler (along with other information such as the host name, user name, and password). Upon connection, mysql_real_connect() sets the reconnect flag (part of the MYSQL structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the MYSQL_OPT_RECONNECT option to mysql_options() to control reconnection behavior. When you are done with the connection, call mysql_close() to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. Treat these statements the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Choose the approach that is most appropriate for each client application. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you do not have random access to rows within the result set (you can only access rows sequentially), and the number of rows in the result set is unknown until you have retrieved them all. Furthermore, you *must* retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but did not. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects

subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

27.7.7 C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)                  /* correct */
    ... error ...

if (result < 0)              /* incorrect */
    ... error ...

if (result == -1)            /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

27.7.7.1 mysql_affected_rows()

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

Description

`mysql_affected_rows()` may be called immediately after executing a statement with `mysql_query()` or `mysql_real_query()`. It returns the number of rows changed, deleted, or inserted by the last statement if it was an `UPDATE`, `DELETE`, or `INSERT`. For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

For `UPDATE` statements, the affected-rows value by default is the number of rows actually changed. If you specify the `CLIENT_FOUND_ROWS` flag to `mysql_real_connect()` when connecting to `mysqld`, the affected-rows value is the number of rows “found”; that is, matched by the `WHERE` clause.

For `REPLACE` statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For `INSERT ... ON DUPLICATE KEY UPDATE` statements, the affected-rows value per row is 1 if the row is inserted as a new row, 2 if an existing row is updated, and 0 if an existing row is set to its current values. If you specify the `CLIENT_FOUND_ROWS` flag, the affected-rows value is 1 (not 0) if an existing row is set to its current values.

Following a `CALL` statement for a stored procedure, `mysql_affected_rows()` returns the value that it would return for the last statement executed within the procedure, or `0` if that statement would return `-1`. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the affected-rows value for individual statements.

`mysql_affected_rows()` returns a meaningful value for a wide range of statements. For details, see the description for `ROW_COUNT()` in Section 12.14, “Information Functions”.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`.

Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

Errors

None.

Example

```
char *stmt = "UPDATE products SET cost=cost*1.25
              WHERE group=10";
mysql_query(&mysql,stmt);
printf("%ld products updated",
       (long) mysql_affected_rows(&mysql));
```

27.7.7.2 mysql_autocommit()

```
bool mysql_autocommit(MYSQL *mysql, bool mode)
```

Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

27.7.7.3 mysql_change_user()

```
bool mysql_change_user(MYSQL *mysql, const char *user, const char *password,
const char *db)
```

Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that include no explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or does not have permission to use the database. In this case, the user and database are not changed.

Pass a `db` parameter of `NULL` if you do not want to have a default database.

This function resets the session state as if one had done a new connect and reauthenticated. (See Section 27.7.24, “C API Automatic Reconnection Control”.) It always performs a `ROLLBACK` of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These effects occur even if the user did not change.

To reset the connection state in a more lightweight manner without changing the user, use `mysql_reset_connection()`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

The same that you can get from `mysql_real_connect()`, plus:

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

- `ER_UNKNOWN_COM_ERROR`

  The MySQL server does not implement this command (probably an old server).

- `ER_ACCESS_DENIED_ERROR`

  The user or password was wrong.

- `ER_BAD_DB_ERROR`

  The database did not exist.

- `ER_DBACCESS_DENIED_ERROR`

  The user did not have access rights to the database.

- `ER_WRONG_DB_NAME`

  The database name was too long.

Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
   fprintf(stderr, "Failed to change user.  Error: %s\n",
           mysql_error(&mysql));
}
```

27.7.7.4 mysql_character_set_name()

```
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.

Return Values

The default character set name

Errors

None.

27.7.7.5 mysql_close()

```
void mysql_close(MYSQL *mysql)
```

Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handler pointed to by `mysql` if the handler was allocated automatically by `mysql_init()` or `mysql_connect()`.

Return Values

None.

Errors

None.

27.7.7.6 mysql_commit()

```
bool mysql_commit(MYSQL *mysql)
```

Description

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

27.7.7.7 mysql_connect()

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const
char *passwd)
```

Description

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you cannot retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

Return Values

Same as for `mysql_real_connect()`.

Errors

Same as for `mysql_real_connect()`.

27.7.7.8 mysql_create_db()

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

Description

Creates the database named by the `db` parameter.

This function is deprecated. Use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

```
if(mysql_create_db(&mysql, "my_database"))
{
   fprintf(stderr, "Failed to create new database.  Error: %s\n",
           mysql_error(&mysql));
}
```

27.7.7.9 mysql_data_seek()

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number. Specify a value in the range from `0` to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

None.

Errors

None.

27.7.7.10 mysql_debug()

```
void mysql_debug(const char *debug)
```

Description

Does a `DBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See Section 28.5.3, “The DBUG Package”.

Return Values

None.

Errors

None.

Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:O,/tmp/client.trace");
```

27.7.7.11 mysql_drop_db()

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

Description

Drops the database named by the `db` parameter.

This function is deprecated. Use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

```
if(mysql_drop_db(&mysql, "my_database"))
  fprintf(stderr, "Failed to drop the database: Error: %s\n",
          mysql_error(&mysql));
```

27.7.7.12 mysql_dump_debug_info()

```
int mysql_dump_debug_info(MYSQL *mysql)
```

Description

Instructs the server to write debugging information to the error log. The connected user must have the `SUPER` privilege.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.13 mysql_eof()

```
bool mysql_eof(MYSQL_RES *result)
```

Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because

`mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero for success. Nonzero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result))  // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql))  // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

27.7.7.14 mysql_errno()

```
unsigned int mysql_errno(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at Appendix B, *Errors, Error Codes, and Common Problems*.

Note

Some functions such as `mysql_fetch_row()` do not set `mysql_errno()` if they succeed. A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
```

```
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

Errors

None.

27.7.7.15 mysql_error()

```
const char *mysql_error(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function did not fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, either of these two tests can be used to check for an error:

```
if(*mysql_error(&mysql))
{
  // an error occurred
}

if(mysql_error(&mysql)[0])
{
  // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages. See Section 10.2, “Setting the Error Message Language”.

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

27.7.7.16 mysql_escape_string()

Note

Do not use this function. `mysql_escape_string()` does not have arguments that enable it to respect the current character set or the quoting context. Use `mysql_real_escape_string_quote()` instead.

27.7.7.17 mysql_fetch_field()

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 27.7.23, “C API Optional Result Set Metadata”.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL does not know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left or if the result set has no metadata.

Errors

None.

Example

```
MYSQL_FIELD *field;

while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

27.7.7.18 mysql_fetch_field_direct()

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int
fieldnr)
```

Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. Use this function to retrieve the definition for an arbitrary column. Specify a value for `fieldnr` in the range from 0 to `mysql_num_fields(result)-1`.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 27.7.23, “C API Optional Result Set Metadata”.

Return Values

The `MYSQL_FIELD` structure for the specified column. `NULL` if the result set has no metadata.

Errors

None.

Example

```
unsigned int num_fields;
```

```
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

27.7.7.19 mysql_fetch_fields()

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 27.7.23, “C API Optional Result Set Metadata”.

Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set. `NULL` if the result set has no metadata.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
   printf("Field %u is %s\n", i, fields[i].name);
}
```

27.7.7.20 mysql_fetch_lengths()

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null bytes). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

Example

```
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
         printf("Column %u is %lu bytes in length.\n",
                i, lengths[i]);
    }
}
```

27.7.7.21 mysql_fetch_row()

`MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)`

Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

Errors

Errors are not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

```
MYSQL_ROW row;
```

```
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
   unsigned long *lengths;
   lengths = mysql_fetch_lengths(result);
   for(i = 0; i < num_fields; i++)
   {
       printf("[%.*s] ", (int) lengths[i],
              row[i] ? row[i] : "NULL");
   }
   printf("\n");
}
```

27.7.7.22 mysql_field_count()

```
unsigned int mysql_field_count(MYSQL *mysql)
```

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 27.7.25.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result)  // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else  // mysql_store_result() returned nothing; should it have?
    {
        if(mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
```

```
        else // mysql_store_result() should have returned data
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
    }
}
```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

27.7.7.23 mysql_field_seek()

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET
offset)
```

Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

27.7.7.24 mysql_field_tell()

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

Return Values

The current offset of the field cursor.

Errors

None.

27.7.7.25 mysql_free_result()

```
void mysql_free_result(MYSQL_RES *result)
```

Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

27.7.7.26 mysql_get_character_set_info()

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

Description

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

Example

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: %d\n", cs.number);
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

27.7.7.27 mysql_get_client_info()

```
const char *mysql_get_client_info(void)
```

Description

Returns a string that represents the MySQL client library version; for example, `"8.0.4"`.

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see Section 27.7.4.5, “C API Server and Client Library Versions”.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

27.7.7.28 mysql_get_client_version()

```
unsigned long mysql_get_client_version(void)
```

Description

Returns an integer that represents the MySQL client library version. The value has the format `XYYZZ` where `X` is the major version, `YY` is the release level (or minor version), and `ZZ` is the sub-version within the release level:

```
major_version*10000 + release_level*100 + sub_version
```

For example, `"8.0.4"` is returned as `80004`.

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see Section 27.7.4.5, “C API Server and Client Library Versions”.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

27.7.7.29 mysql_get_host_info()

```
const char *mysql_get_host_info(MYSQL *mysql)
```

Description

Returns a string describing the type of connection in use, including the server host name.

Return Values

A character string representing the server host name and the connection type.

Errors

None.

27.7.7.30 mysql_get_option()

```
int mysql_get_option(MYSQL *mysql, enum mysql_option option, const void
*arg)
```

Description

Returns the current value of an option settable using `mysql_options()`. The value should be treated as read only.

The `option` argument is the option for which you want its value. The `arg` argument is a pointer to a variable in which to store the option value. `arg` must be a pointer to a variable of the type appropriate for the `option` argument. The following table shows which variable type to use for each `option` value.

`arg` Type	Applicable `option` Values
`unsigned int`	`MYSQL_OPT_CONNECT_TIMEOUT`, `MYSQL_OPT_PROTOCOL`, `MYSQL_OPT_READ_TIMEOUT`, `MYSQL_OPT_SSL_MODE`, `MYSQL_OPT_RETRY_COUNT`, `MYSQL_OPT_WRITE_TIMEOUT`
`unsigned long`	`MYSQL_OPT_MAX_ALLOWED_PACKET`, `MYSQL_OPT_NET_BUFFER_LENGTH`
`bool`	`MYSQL_ENABLE_CLEARTEXT_PLUGIN`, `MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS`, `MYSQL_OPT_COMPRESS`, `MYSQL_OPT_GET_SERVER_PUBLIC_KEY`, `MYSQL_OPT_GUESS_CONNECTION`, `MYSQL_OPT_LOCAL_INFILE`, `MYSQL_OPT_OPTIONAL_RESULTSET_METADATA`, `MYSQL_OPT_RECONNECT`, `MYSQL_OPT_USE_EMBEDDED_CONNECTION`, `MYSQL_OPT_USE_REMOTE_CONNECTION`, `MYSQL_REPORT_DATA_TRUNCATION`, `MYSQL_SECURE_AUTH`
`const char *`	`MYSQL_DEFAULT_AUTH`, `MYSQL_OPT_BIND`, `MYSQL_OPT_SSL_CA`, `MYSQL_OPT_SSL_CAPATH` , `MYSQL_OPT_SSL_CERT`, `MYSQL_OPT_SSL_CIPHER`, `MYSQL_OPT_SSL_CRL`, `MYSQL_OPT_SSL_CRLPATH`, `MYSQL_OPT_SSL_KEY`, `MYSQL_OPT_TLS_VERSION`, `MYSQL_PLUGIN_DIR`, `MYSQL_READ_DEFAULT_FILE`, `MYSQL_READ_DEFAULT_GROUP`,

`arg` Type	Applicable `option` Values
	`MYSQL_SERVER_PUBLIC_KEY`, `MYSQL_SET_CHARSET_DIR`, `MYSQL_SET_CHARSET_NAME`, `MYSQL_SET_CLIENT_IP`, `MYSQL_SHARED_MEMORY_BASE_NAME`
cannot be queried (error is returned)	`MYSQL_INIT_COMMAND`, `MYSQL_OPT_CONNECT_ATTR_DELETE`, `MYSQL_OPT_CONNECT_ATTR_RESET`, `MYSQL_OPT_NAMED_PIPE`

Return Values

Zero for success. Nonzero if an error occurred; this occurs for `option` values that cannot be queried.

Example

The following call tests the `MYSQL_OPT_RECONNECT` option. After the call returns successfully, the value of `reconnect` is true or false to indicate whether automatic reconnection is enabled.

```
bool reconnect;

if (mysql_get_option(mysql, MYSQL_OPT_RECONNECT, &reconnect))
  fprintf(stderr, "mysql_get_options() failed\n");
```

27.7.7.31 mysql_get_proto_info()

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

27.7.7.32 mysql_get_server_info()

```
const char *mysql_get_server_info(MYSQL *mysql)
```

Description

Returns a string that represents the MySQL server version; for example, `"8.0.4"`.

Return Values

A character string that represents the MySQL server version.

Errors

None.

27.7.7.33 mysql_get_server_version()

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

Description

Returns an integer that represents the MySQL server version. The value has the format `XYYZZ` where `X` is the major version, `YY` is the release level (or minor version), and `ZZ` is the sub-version within the release level:

```
major_version*10000 + release_level*100 + sub_version
```

For example, `"8.0.4"` is returned as `80004`.

This function is useful in client programs for determining whether some version-specific server capability exists.

Return Values

An integer that represents the MySQL server version.

Errors

None.

27.7.7.34 mysql_get_ssl_cipher()

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

Description

`mysql_get_ssl_cipher()` returns the encryption cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

Return Values

A string naming the encryption cipher used for the connection, or `NULL` if the connection is not encrypted.

27.7.7.35 mysql_hex_string()

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long
length)
```

Description

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

The string in the `from` argument is encoded in hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in the `to` argument, followed by a terminating null byte.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The return value can be placed into an SQL statement using either `X'value'` or `0xvalue` format. However, the return value does not include the `X'...'` or `0x`. The caller must supply whichever of those is desired.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"X'");
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,"',X'");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
end = strmov(end,"')");
```

```
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
   fprintf(stderr, "Failed to insert row, Error: %s\n",
           mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into `to`, not including the terminating null character.

Errors

None.

27.7.7.36 mysql_info()

```
const char *mysql_info(MYSQL *mysql)
```

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`

  String format: `Records: 100 Duplicates: 0 Warnings: 0`

- `INSERT INTO ... VALUES (...),(...),(...)...`

  String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `LOAD DATA INFILE ...`

  String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`

- `ALTER TABLE`

  String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `UPDATE`

  String format: `Rows matched: 40 Changed: 40 Warnings: 0`

`mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

Errors

None.

27.7.7.37 mysql_init()

```
MYSQL *mysql_init(MYSQL *mysql)
```

Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

In a nonmulti-threaded environment, `mysql_init()` invokes `mysql_library_init()` automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`. Before calling `mysql_init()`, either call `mysql_library_init()` prior to spawning any threads, or use a mutex to protect the `mysql_library_init()` call. This should be done prior to any other client library call.

Return Values

An initialized `MYSQL*` handler. `NULL` if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, `NULL` is returned.

27.7.7.38 mysql_insert_id()

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit nonspecial value.
- In the case of a multiple-row `INSERT` statement, `mysql_insert_id()` returns the first automatically generated `AUTO_INCREMENT` value that was successfully inserted.

  If no rows are successfully inserted, `mysql_insert_id()` returns 0.
- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- If an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, `mysql_insert_id()` returns *`expr`*.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

The return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an `AUTO_INCREMENT` column, and an automatically generated value was successfully inserted, return the first such value.
2. If `LAST_INSERT_ID(expr)` occurred in the statement, return *`expr`*, even if there was an `AUTO_INCREMENT` column in the affected table.

3. The return value varies depending on the statement used. When called after an `INSERT` statement:

   - If there is an `AUTO_INCREMENT` column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

   When called after an `INSERT ... ON DUPLICATE KEY UPDATE` statement:

   - If there is an `AUTO_INCREMENT` column in the table and there were some explicit successfully inserted values or some updated values, return the last of the inserted or updated values.

`mysql_insert_id()` returns `0` if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function will contain the value of the first automatically generated value that was successfully inserted. `LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific nonspecial value. See Section 12.14, “Information Functions”.

`mysql_insert_id()` returns `0` following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

- `ER_AUTO_INCREMENT_CONFLICT`

  A user-specified `AUTO_INCREMENT` value in a multi `INSERT` statement falls within the range between the current `AUTO_INCREMENT` value and the sum of the current and number of rows affected values.

27.7.7.39 mysql_kill()

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Note

`mysql_kill()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `KILL` statement.

Asks the server to kill the thread specified by `pid`.

This function is deprecated. Use `mysql_query()` to issue an SQL `KILL` statement instead.

`mysql_kill()` cannot handle values larger than 32 bits, but to guard against killing the wrong thread returns an error in these cases:

- If given an ID larger than 32 bits, `mysql_kill()` returns a `CR_INVALID_CONN_HANDLE` error.

- After the server's internal thread ID counter reaches a value larger than 32 bits, it returns an `ER_DATA_OUT_OF_RANGE` error for any `mysql_kill()` invocation and `mysql_kill()` fails.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_INVALID_CONN_HANDLE`

  The `pid` was larger than 32 bits.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

- `ER_DATA_OUT_OF_RANGE`

  The server's internal thread ID counter has reached a value larger than 32 bits, at which point it rejects all `mysql_kill()` invocations.

27.7.7.40 mysql_library_end()

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. Call it when you are done using the library (for example, after disconnecting from the server). `mysql_library_end()` performs some memory management to clean up.

For usage information, see Section 27.7.6, “C API Function Overview”, and Section 27.7.7.41, “mysql_library_init()”.

27.7.7.41 mysql_library_init()

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

Call this function to initialize the MySQL library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See Section 27.7.7.40, “mysql_library_end()”.

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is

not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. Do this prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be `0` (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (nonembedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
  if (mysql_library_init(0, NULL, NULL)) {
    fprintf(stderr, "could not initialize MySQL library\n");
    exit(1);
  }

  /* Use any MySQL API functions here */

  mysql_library_end();

  return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than `0`), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument is an array of strings that indicate the groups in option files from which to read options. See Section 4.2.6, “Using Option Files”. Make the final entry in the array `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
  "this_program",       /* this string is not used */
  "--datadir=.",
  "--key_buffer_size=32M"
};
static char *server_groups[] = {
  "embedded",
  "server",
  "this_program_SERVER",
  (char *)NULL
};

int main(void) {
  if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                         server_args, server_groups)) {
    fprintf(stderr, "could not initialize MySQL library\n");
    exit(1);
  }

  /* Use any MySQL API functions here */

  mysql_library_end();

  return EXIT_SUCCESS;
}
```

Return Values

Zero for success. Nonzero if an error occurred.

27.7.7.42 mysql_list_dbs()

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.43 mysql_list_fields()

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char
*wild)
```

Description

Note

`mysql_list_fields()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHOW COLUMNS` statement.

Returns an empty result set for which the metadata provides information about the columns in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

```
int i;
MYSQL_RES *tbl_cols = mysql_list_fields(mysql, "mytbl", "f%");

unsigned int field_cnt = mysql_num_fields(tbl_cols);
printf("Number of columns: %d\n", field_cnt);

for (i=0; i < field_cnt; ++i)
{
  /* col describes i-th column of the table */
  MYSQL_FIELD *col = mysql_fetch_field_direct(tbl_cols, i);
  printf ("Column %d: %s\n", i, col->name);
}
mysql_free_result(tbl_cols);
```

27.7.7.44 mysql_list_processes()

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Note

`mysql_list_processes()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHOW PROCESSLIST` statement.

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.45 mysql_list_tables()

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.46 mysql_more_results()

```
bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See Section 27.7.19, “C API Multiple Statement Execution Support”, and Section 27.7.7.47, “mysql_next_result()”.

Errors

None.

27.7.7.47 mysql_next_result()

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). `CLIENT_MULTI_RESULTS` is enabled by default.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see Section 27.7.19, “C API Multiple Statement Execution Support”.

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order. For example, if you did not call `mysql_use_result()` for a previous result set.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.48 mysql_num_fields()

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

You can get the number of columns either from a pointer to a result set or to a connection handler. You would use the connection handler if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 27.7.25.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result)  // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else  // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
           fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
```

```
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

27.7.7.49 mysql_num_rows()

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

27.7.7.50 mysql_options()

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options. To retrieve option values, use `mysql_get_option()`.

Call `mysql_options()` after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, specify a pointer to the value of the integer as the `arg` argument.

Options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 27.7.18, “C API Encrypted Connection Support”.

The following list describes the possible options, their effect, and how `arg` is used for each option. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

Note

Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked

against the `libmysqlclient` client library. The embedded server library is removed in MySQL 8.0, so these options are obsolete.

- `MYSQL_DEFAULT_AUTH` (argument type: `char *`)

  The name of the authentication plugin to use.

- `MYSQL_ENABLE_CLEARTEXT_PLUGIN` (argument type: `bool *`)

  Enable the `mysql_clear_password` cleartext authentication plugin. See Section 6.5.1.4, "Client-Side Cleartext Pluggable Authentication".

- `MYSQL_INIT_COMMAND` (argument type: `char *`)

  SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- `MYSQL_OPT_BIND` (argument: `char *`)

  The network interface from which to connect to the server. This is used when the client host has multiple network interfaces. The argument is a host name or IP address (specified as a string).

- `MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS` (argument type: `bool *`)

  Indicate whether the client can handle expired passwords. See Section 6.3.9, "Password Expiration and Sandbox Mode".

- `MYSQL_OPT_COMPRESS` (argument: not used)

  Use the compressed client/server protocol.

- `MYSQL_OPT_CONNECT_ATTR_DELETE` (argument type: `char *`)

  Given a key name, this option deletes a key/value pair from the current set of connection attributes to pass to the server at connect time. The argument is a pointer to a null-terminated string naming the key. Comparison of the key name with existing keys is case sensitive.

  See also the description for the `MYSQL_OPT_CONNECT_ATTR_RESET` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

  The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See Section 25.11.9, "Performance Schema Connection Attribute Tables".

- `MYSQL_OPT_CONNECT_ATTR_RESET` (argument not used)

  This option resets (clears) the current set of connection attributes to pass to the server at connect time.

  See also the description for the `MYSQL_OPT_CONNECT_ATTR_DELETE` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

  The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See Section 25.11.9, "Performance Schema Connection Attribute Tables".

- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)

  The connect timeout in seconds.

- `MYSQL_OPT_GET_SERVER_PUBLIC_KEY` (argument type: `bool *`)

Enables the client to request the public key that is required for RSA key pair-based password exchange. (The server does not send the public key to the client unless requested.) This option is used by clients that connect to the server using an account that authenticates with the `caching_sha2_password` authentication plugin. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not needed, as is the case when the client connects to the server using a secure connection.

For information about the `caching_sha2_password` plugin, see Section 6.5.1.3, "SHA-2 Pluggable Authentication".

This option was added in MySQL 8.0.3.

- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

  Note

  The embedded server library is removed in MySQL 8.0, so this option is obsolete.

  For an application linked against the `libmysqld` embedded server library, this option enables the library to guess whether to use the embedded server or a remote server. "Guess" means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

  This option affects client-side `LOCAL` capability for `LOAD DATA` operations. By default, `LOCAL` capability is determined by the default compiled into the MySQL client library (see Section 13.2.7, "LOAD DATA INFILE Syntax"). To control this capability explicitly, invoke `mysql_options()` to set the `MYSQL_OPT_LOCAL_INFILE` option:

  - `LOCAL` is disabled if the pointer points to an `unsigned int` that has a zero value.
  - `LOCAL` is enabled if no pointer is given or if the pointer points to an `unsigned int` that has a nonzero value.

  Successful use of a `LOCAL` load operation by a client also requires that the server permits it.

- `MYSQL_OPT_MAX_ALLOWED_PACKET` (argument: `unsigned long *`)

  This option sets the `max_allowed_packet` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

  Use a named pipe to connect to the MySQL server on Windows, if the server permits named-pipe connections.

- `MYSQL_OPT_NET_BUFFER_LENGTH` (argument: `unsigned long *`)

  This option sets the `net_buffer_length` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- `MYSQL_OPT_OPTIONAL_RESULTSET_METADATA` (argument type: `bool *`)

  This flag makes result set metadata optional. It is an alternative way of setting the `CLIENT_OPTIONAL_RESULTSET_METADATA` connection flag for the `mysql_real_connect()`

function. For details about managing result set metadata transfer, see Section 27.7.23, “C API Optional Result Set Metadata”. This flag was added in MySQL 8.0.3.

- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

  Type of protocol to use. Specify one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

  The timeout in seconds for each attempt to read from the server. There are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes.

- `MYSQL_OPT_RECONNECT` (argument type: `bool *`)

  Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly. See Section 27.7.24, “C API Automatic Reconnection Control”.

- `MYSQL_OPT_RETRY_COUNT` (argument type: `unsigned int *`)

  The retry count for I/O-related system calls that are interrupted while connecting to the server or communicating with it. The default value is 1 (1 retry if the initial call is interrupted for 2 tries total).

- `MYSQL_OPT_SSL_CA` (argument type: `char *`)

  The path to a file in PEM format that contains a list of trusted SSL CAs.

- `MYSQL_OPT_SSL_CAPATH` (argument type: `char *`)

  The path to a directory that contains trusted SSL CA certificates in PEM format.

- `MYSQL_OPT_SSL_CERT` (argument type: `char *`)

  The name of an SSL certificate file in PEM format to use for establishing an encrypted connection.

- `MYSQL_OPT_SSL_CIPHER` (argument type: `char *`)

  A list of permissible ciphers to use for SSL encryption.

- `MYSQL_OPT_SSL_CRL` (argument type: `char *`)

  The path to a file containing certificate revocation lists in PEM format.

- `MYSQL_OPT_SSL_CRLPATH` (argument type: `char *`)

  The path to a directory that contains files containing certificate revocation lists in PEM format.

- `MYSQL_OPT_SSL_KEY` (argument type: `char *`)

  The name of an SSL key file in PEM format to use for establishing an encrypted connection.

- `MYSQL_OPT_SSL_MODE` (argument type: `unsigned int *`)

  The security state to use for the connection to the server: `SSL_MODE_DISABLED`, `SSL_MODE_PREFERRED`, `SSL_MODE_REQUIRED`, `SSL_MODE_VERIFY_CA`, `SSL_MODE_VERIFY_IDENTITY`. The default is `SSL_MODE_PREFERRED`. These modes are the permitted values of the `mysql_ssl_mode` enumeration defined in `mysql.h`. For more information about the security states, see the description of `--ssl-mode` in Section 6.4.2, “Command Options for Encrypted Connections”.

- `MYSQL_OPT_TLS_VERSION` (argument type: `char *`)

The protocols permitted by the client for encrypted connections. The value is a comma-separated list containing one or more protocol names. The protocols that can be named for this option depend on the SSL library used to compile MySQL. For details, see Section 6.4.6, “Encrypted Connection Protocols and Ciphers”.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

  Note

  The embedded server library is removed in MySQL 8.0, so this option is obsolete.

  For an application linked against the `libmysqld` embedded server library, this option forces the use of the embedded server for the connection. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

  Note

  The embedded server library is removed in MySQL 8.0, so this option is obsolete.

  For an application linked against the `libmysqld` embedded server library, this option forces the use of a remote server for the connection. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

  This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

  The timeout in seconds for each attempt to write to the server. There is a retry if necessary, so the total effective timeout value is two times the option value.

- `MYSQL_PLUGIN_DIR` (argument type: `char *`)

  The directory in which to look for client plugins.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

  Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

  Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `bool *`)

  Enable or disable reporting of data truncation errors for prepared statements using the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `bool *`)

  This option was removed in MySQL 8.0.3.

- `MYSQL_SERVER_PUBLIC_KEY` (argument type: `char *`)

  The path name to a file containing the same RSA public key used by the server. The file must be in PEM format. The public key is required for RSA key pair-based password exchange. This option

can be used by clients that connect to the server using an account that authenticates with the `sha256_password` or `caching_sha2_password` plugin. This option is ignored for accounts that do not authenticate with one of those plugins. It is also ignored if RSA-based password exchange is not needed, as is the case when the client connects to the server using a secure connection.

The server sends the public key to the client as needed, so it is not necessary to use this option for RSA password encryption to occur. It is more efficient to do so because then the server need not send the key.

For information about the `sha256_password` and `caching_sha2_password` plugins, see Section 6.5.1.2, "SHA-256 Pluggable Authentication", and Section 6.5.1.3, "SHA-2 Pluggable Authentication".

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

  The path name to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

  The name of the character set to use as the default character set. The argument can be `MYSQL_AUTODETECT_CHARSET_NAME` to cause the character set to be autodetected based on the operating system setting (see Section 10.1.4, "Connection Character Sets and Collations").

- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)

  Note

  The embedded server library is removed in MySQL 8.0, so this option is obsolete.

  For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this option means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

  The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Specify the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
`character-sets-dir=`*`dir_name`*	The directory where character sets are installed.
`compress`	Use the compressed client/server protocol.
`connect-timeout=`*`seconds`*	The connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
`database=`*`db_name`*	Connect to this database if no database was specified in the connect command.
`debug`	Debug options.
`default-character-set=`*`charset_name`*	The default character set to use.
`disable-local-infile`	Disable use of `LOAD DATA LOCAL INFILE`.

Option	Description
`enable-cleartext-plugin`	Enable the `mysql_clear_password` cleartext authentication plugin.
`host=host_name`	Default host name.
`init-command=stmt`	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
`interactive-timeout=seconds`	Same as specifying `CLIENT_INTERACTIVE` to `mysql_real_connect()`. See Section 27.7.7.54, “mysql_real_connect()”.
`local-infile[={0|1}]`	If no argument or nonzero argument, enable use of `LOAD DATA LOCAL`; otherwise disable.
`max_allowed_packet=bytes`	Maximum size of packet that client can read from server.
`multi-queries`, `multi-results`	Enable multiple result sets from multiple-statement executions or stored procedures.
`multi-statements`	Enable the client to send multiple statements in a single string (separated by `;` characters).
`password=password`	Default password.
`pipe`	Use named pipes to connect to a MySQL server on Windows.
`port=port_num`	Default port number.
`protocol={TCP|SOCKET|PIPE|MEMORY}`	The protocol to use when connecting to the server.
`return-found-rows`	Tell `mysql_info()` to return found rows instead of updated rows when using `UPDATE`.
`shared-memory-base-name=name`	Shared-memory name to use to connect to server.
`socket={file_name|pipe_name}`	Default socket file.
`ssl-ca=file_name`	Certificate Authority file.
`ssl-capath=dir_name`	Certificate Authority directory.
`ssl-cert=file_name`	Certificate file.
`ssl-cipher=cipher_list`	Permissible SSL ciphers.
`ssl-key=file_name`	Key file.
`timeout=seconds`	Like `connect-timeout`.
`user`	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported for backward compatibility.

For more information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

Return Values

Zero for success. Nonzero if you specify an unknown option.

Example

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the `[odbc]` group in option files, and disable transaction autocommit mode:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_COMPRESS,0);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
mysql_options(&mysql,MYSQL_INIT_COMMAND,"SET autocommit=0");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}
```

27.7.7.51 mysql_options4()

```
int mysql_options4(MYSQL *mysql, enum mysql_option option, const void *arg1,
const void *arg2)
```

Description

`mysql_options4()` is similar to `mysql_options()` but has an extra fourth argument so that two values can be passed for the option specified in the second argument.

The following list describes the permitted options, their effect, and how `arg1` and `arg2` are used.

- `MYSQL_OPT_CONNECT_ATTR_ADD` (argument types: `char *, char *`)

  This option adds an attribute key/value pair to the current set of connection attributes to pass to the server at connect time. Both arguments are pointers to null-terminated strings. The first and second strings indicate the key and value, respectively. If the key is empty or already exists in the current set of connection attributes, an error occurs. Comparison of the key name with existing keys is case sensitive.

  Key names that begin with an underscore (_) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes.

  `mysql_options4()` imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. For calls that cause this limit to be exceeded, a `CR_INVALID_PARAMETER_NO` error occurs. Attribute size-limit checks also occur on the server side. For details, see Section 25.11.9, “Performance Schema Connection Attribute Tables”, which also describes how the Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables.

  See also the descriptions for the `MYSQL_OPT_CONNECT_ATTR_RESET` `MYSQL_OPT_CONNECT_ATTR_DELETE` options in the description of the `mysql_options()` function.

Return Values

Zero for success. Nonzero if you specify an unknown option.

Errors

- `CR_DUPLICATE_CONNECTION_ATTR`

  A duplicate attribute name was specified.

- `CR_INVALID_PARAMETER_NO`

  A key name was empty or the amount of key/value connection attribute data exceeds 64KB limit.

- `CR_OUT_OF_MEMORY`

Out of memory.

Example

This example demonstrates the calls that specify connection attributes:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_CONNECT_ATTR_RESET, 0);
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key1", "value1");
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key2", "value2");
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key3", "value3");
mysql_options(&mysql,MYSQL_OPT_CONNECT_ATTR_DELETE, "key1");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
        mysql_error(&mysql));
}
```

27.7.7.52 mysql_ping()

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option. For details, see Section 27.7.7.50, “mysql_options()”.

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If `mysql_ping()`) does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see Section 27.7.24, “C API Automatic Reconnection Control”.

Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.53 mysql_query()

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 27.7.19, “C API Multiple Statement Execution Support”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See Section 27.7.7.22, “mysql_field_count()”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.54 mysql_real_connect()

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char
*user, const char *passwd, const char *db, unsigned int port, const char
*unix_socket, unsigned long client_flag)
```

Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handler structure.

The parameters are specified as follows:

- For the first parameter, specify the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()`, call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See Section 27.7.7.50, “mysql_options()”.

- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string `"localhost"`, a connection to the local host is assumed. For Windows, the client connects

using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of `"."` on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.

- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string `""`, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the Connector/ODBC section of Chapter 27, *Connectors and APIs*.

- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

  Note

  Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `utf8mb4`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.

- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.

- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.

- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe to use. Note that the `host` parameter determines the type of the connection.

- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:

  - `CAN_HANDLE_EXPIRED_PASSWORDS`: The client can handle expired passwords. For more information, see Section 6.3.9, “Password Expiration and Sandbox Mode”.

  - `CLIENT_COMPRESS`: Use compression in the client/server protocol.

  - `CLIENT_FOUND_ROWS`: Return the number of found (matched) rows, not the number of changed rows.

  - `CLIENT_IGNORE_SIGPIPE`: Prevents the client library from installing a `SIGPIPE` signal handler. This can be used to avoid conflicts with a handler that the application has already installed.

  - `CLIENT_IGNORE_SPACE`: Permit spaces after function names. Makes all functions names reserved words.

  - `CLIENT_INTERACTIVE`: Permit `interactive_timeout` seconds of inactivity (rather than `wait_timeout` seconds) before closing the connection. The client's session `wait_timeout` variable is set to the value of the session `interactive_timeout` variable.

  - `CLIENT_LOCAL_FILES`: Enable `LOAD DATA LOCAL` handling.

  - `CLIENT_MULTI_RESULTS`: Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if

CLIENT_MULTI_STATEMENTS is enabled. See the note following this table for more information about this flag.

- CLIENT_MULTI_STATEMENTS: Tell the server that the client may send multiple statements in a single string (separated by ; characters). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
- CLIENT_NO_SCHEMA Do not permit *db_name.tbl_name.col_name* syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
- CLIENT_ODBC: Unused.
- CLIENT_OPTIONAL_RESULTSET_METADATA: This flag makes result set metadata optional. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each. For details about managing result set metadata transfer, see Section 27.7.23, "C API Optional Result Set Metadata". This flag was added in MySQL 8.0.3.
- CLIENT_SSL: Use SSL (encrypted protocol). Do not set this option within an application program; it is set internally in the client library. Instead, use mysql_options() or mysql_ssl_set() before calling mysql_real_connect().
- CLIENT_REMEMBER_OPTIONS Remember options specified by calls to mysql_options(). Without this option, if mysql_real_connect() fails, you must repeat the mysql_options() calls before trying to connect again. With this option, the mysql_options() calls need not be repeated.

If your program uses CALL statements to execute stored procedures, the CLIENT_MULTI_RESULTS flag must be enabled. This is because each CALL returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because CALL can return multiple results, process them using a loop that calls mysql_next_result() to determine whether there are more results.

CLIENT_MULTI_RESULTS can be enabled when you call mysql_real_connect(), either explicitly by passing the CLIENT_MULTI_RESULTS flag itself, or implicitly by passing CLIENT_MULTI_STATEMENTS (which also enables CLIENT_MULTI_RESULTS). CLIENT_MULTI_RESULTS is enabled by default.

If you enable CLIENT_MULTI_STATEMENTS or CLIENT_MULTI_RESULTS, process the result for every call to mysql_query() or mysql_real_query() by using a loop that calls mysql_next_result() to determine whether there are more results. For an example, see Section 27.7.19, "C API Multiple Statement Execution Support".

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the mysql_real_connect() call. To do this, call mysql_options() with the MYSQL_READ_DEFAULT_FILE or MYSQL_READ_DEFAULT_GROUP option before calling mysql_real_connect(). Then, in the mysql_real_connect() call, specify the "no-value" value for each parameter to be read from an option file:

- For host, specify a value of NULL or the empty string ("").
- For user, specify a value of NULL or the empty string.
- For passwd, specify a value of NULL. (For the password, a value of the empty string in the mysql_real_connect() call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For db, specify a value of NULL or the empty string.
- For port, specify a value of 0.
- For unix_socket, specify a value of NULL.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handler if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- `CR_CONN_HOST_ERROR`

  Failed to connect to the MySQL server.

- `CR_CONNECTION_ERROR`

  Failed to connect to the local MySQL server.

- `CR_IPSOCK_ERROR`

  Failed to create an IP socket.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SOCKET_CREATE_ERROR`

  Failed to create a Unix socket.

- `CR_UNKNOWN_HOST`

  Failed to find the IP address for the host name.

- `CR_VERSION_ERROR`

  A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- `CR_NAMEDPIPEOPEN_ERROR`

  Failed to create a named pipe on Windows.

- `CR_NAMEDPIPEWAIT_ERROR`

  Failed to wait for a named pipe on Windows.

- `CR_NAMEDPIPESETSTATE_ERROR`

  Failed to get a pipe handler on Windows.

- `CR_SERVER_LOST`

  If `connect_timeout` > 0 and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

- `CR_ALREADY_CONNECTED`

  The `MYSQL` connection handler is already connected.

Example

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

27.7.7.55 mysql_real_escape_string()

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char
*from, unsigned long length)
```

Description

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

Note

`mysql_real_escape_string()` fails and produces an `CR_INSECURE_API_ERR` error if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled. In this case, the function cannot escape quote characters except by doubling them, and to do this properly, it must know more information about the quoting context than is available. Instead, use `mysql_real_escape_string_quote()`, which takes an extra argument for specifying the quoting context.

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, `NUL` (ASCII 0), `\n`, `\r`, and Control+Z. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in Section 9.1.1, “String Literals”, and Section 12.5, “String Functions”.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement.

`mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```
char query[1000],*end;

end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string(&mysql,end,"What is this",12);
end = my_stpcpy(end,"','");
end += mysql_real_escape_string(&mysql,end,"binary data: \0\r\n",16);
end = my_stpcpy(end,"')");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
   fprintf(stderr, "Failed to insert row, Error: %s\n",
           mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte, or -1 if an error occurs.

Because `mysql_real_escape_string()` returns an unsigned value, you can check for -1 by comparing the return value to `(unsigned long)-1` (or to `(unsigned long)~0`, which is equivalent).

Errors

- `CR_INSECURE_API_ERR`

  This error occurs if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled because, in that case, `mysql_real_escape_string()` cannot be guaranteed to produce a properly encoded result. To avoid this error, use `mysql_real_escape_string_quote()` instead.

27.7.7.56 mysql_real_escape_string_quote()

```
unsigned long mysql_real_escape_string_quote(MYSQL *mysql, char *to, const
char *from, unsigned long length, char quote)
```

Description

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, `NUL` (ASCII 0), `\n`, `\r`, Control+Z, and `` ` ``. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string_quote()` quotes the other characters to make them easier to read

in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in Section 9.1.1, “String Literals”, and Section 12.5, “String Functions”.

Note

If the `ANSI_QUOTES` SQL mode is enabled, `mysql_real_escape_string_quote()` cannot be used to escape double quote characters for use within double-quoted identifiers. (The function cannot tell whether the mode is enabled to determine the proper escaping character.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string_quote()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The `quote` argument indicates the context in which the escaped string is to be placed. Suppose that you intend to escape the `from` argument and insert the escaped string (designated here by *`str`*) into one of the following statements:

```
1) SELECT * FROM table WHERE name = 'str'
2) SELECT * FROM table WHERE name = "str"
3) SELECT * FROM `str` WHERE id = 103
```

To perform escaping properly for each statement, call `mysql_real_escape_string_quote()` as follows, where the final argument indicates the quoting context:

```
1) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'\'');
2) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'"');
3) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'`');
```

If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string_quote()`, which `SET NAMES` does not.

Example

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```
char query[1000],*end;

end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string_quote(&mysql,end,"What is this",12,'\'');
end = my_stpcpy(end,"','");
end += mysql_real_escape_string_quote(&mysql,end,"binary data: \0\r\n",16,'\'');
end = my_stpcpy(end,"')");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
   fprintf(stderr, "Failed to insert row, Error: %s\n",
           mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte.

Errors

None.

27.7.7.57 mysql_real_query()

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long
length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, a string `length` bytes long. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 27.7.19, “C API Multiple Statement Execution Support”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See Section 27.7.7.22, “mysql_field_count()”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.58 mysql_refresh()

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

Note

`mysql_refresh()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `FLUSH` statement.

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bitmask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- `REFRESH_GRANT`

  Refresh the grant tables, like `FLUSH PRIVILEGES`.

- `REFRESH_LOG`

  Flush the logs, like `FLUSH LOGS`.

- `REFRESH_TABLES`

  Flush the table cache, like `FLUSH TABLES`.

- `REFRESH_HOSTS`

  Flush the host cache, like `FLUSH HOSTS`.

- `REFRESH_STATUS`

  Reset status variables, like `FLUSH STATUS`.

- `REFRESH_THREADS`

  Flush the thread cache.

- `REFRESH_SLAVE`

  On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.

- `REFRESH_MASTER`

  On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.59 mysql_reload()

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the `RELOAD` privilege.

This function is deprecated. Use `mysql_query()` to issue an SQL `FLUSH PRIVILEGES` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.60 mysql_reset_connection()

```
int mysql_reset_connection(MYSQL *mysql)
```

Description

Resets the connection to clear the session state.

`mysql_reset_connection()` has effects similar to `mysql_change_user()` or an auto-reconnect except that the connection is not closed and reopened, and reauthentication is not done. See Section 27.7.7.3, “mysql_change_user()”) and see Section 27.7.24, “C API Automatic Reconnection Control”).

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

Return Values

Zero for success. Nonzero if an error occurred.

27.7.7.61 mysql_result_metadata()

```
enum enum_resultset_metadata mysql_result_metadata(MYSQL_RES *result)
```

Description

`mysql_result_metadata()` returns a value that indicates whether a result set has metadata. It can be useful for metadata-optional connections when the client does not know in advance whether particular result sets have metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the `resultset_metadata` system variable, the client can invoke `mysql_result_metadata()` for each result set to determine whether it has metadata.

For details about managing result set metadata transfer, see Section 27.7.23, “C API Optional Result Set Metadata”.

Return Values

`mysql_result_metadata()` returns one of these values:

```
enum enum_resultset_metadata {
 RESULTSET_METADATA_NONE= 0,
 RESULTSET_METADATA_FULL= 1
};
```

27.7.7.62 mysql_rollback()

```
bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

27.7.7.63 mysql_row_seek()

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset, typically a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

27.7.7.64 mysql_row_tell()

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

Use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

27.7.7.65 mysql_select_db()

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that include no explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

27.7.7.66 mysql_server_init()

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See Section 27.7.7.41, “mysql_library_init()”.

Return Values

Zero for success. Nonzero if an error occurred.

27.7.7.67 mysql_server_end()

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See Section 27.7.7.40, “mysql_library_end()”.

Return Values

None.

27.7.7.68 mysql_session_track_get_first()

```
int mysql_session_track_get_first(MYSQL *mysql, enum enum_session_state_type
type, const char **data, size_t *length)
```

Description

This function fetches the first session state-change information received from the server.

To control notification for changes to session state, use the `session_track_state_change`, `session_track_schema`, `session_track_system_variables`, and `session_track_gtids` system variables (see Section 5.1.5, “Server System Variables”).

The function parameters are used as follows. These descriptions also apply to `mysql_session_track_get_next()`, which takes the same parameters.

- `mysql`: The connection handler.
- `type`: The type of information to retrieve. Permitted values for this parameter are the members of the `enum_session_state_type` enumeration defined in `mysql_com.h`:

```
enum enum_session_state_type
{
  SESSION_TRACK_SYSTEM_VARIABLES, /* Session system variables */
  SESSION_TRACK_SCHEMA,           /* Current schema */
  SESSION_TRACK_STATE_CHANGE      /* track session state changes */
  SESSION_TRACK_GTIDS,            /* track GTIDs/*
};
```

To make it easy to loop over all possible types of session information, the `SESSION_TRACK_BEGIN` and `SESSION_TRACK_END` macros are defined to be equal to the first and last members of the `enum_session_state_type` enumeration. The example code shown later in this section demonstrates this technique.

- `data`: The address of a `const char *` variable. Following a successful call, this variable points to the returned data, which should be considered read only.
- `length`: The address of a `size_t` variable. Following a successful call, this variable contains the length of the data pointed to by the `data` parameter.

Following a successful call, interpret the `data` and `length` values according to the `type` value, as follows:

- `SESSION_TRACK_SCHEMA`: `data` is the new default schema name and `length` is the name length.
- `SESSION_TRACK_SYSTEM_VARIABLES`: When a session system variable changes, two values per variable are returned (in separate calls). For the first call, `data` is the variable name and `length` is the name length. For the second call, `data` is the variable value and `length` is the value length. value Both data values are represented as strings.
- `SESSION_TRACK_STATE_CHANGE`: `data` is a byte containing a boolean flag that indicates whether session state changes occurred and `length` should be 1. The flag is represented as an ASCII value, not a binary (for example, `'1'`, not `0x01`).
- `SESSION_TRACK_GTIDS`: `data` contains the GTID set information and `length` is its length.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

Example

The following example shows how to call `mysql_session_track_get_first()` and `mysql_session_track_get_next()` to retrieve and display all available session state-change information following successful execution of an SQL statement string (represented by `stmt_str`).

```
printf("Execute: %s\n", stmt_str);

if (mysql_query(mysql, stmt_str) != 0)
{
  fprintf(stderr, "Error %u: %s\n",
          mysql_errno(mysql), mysql_error(mysql));
  return;
}

MYSQL_RES *result = mysql_store_result(mysql);
if (result) /* there is a result set to fetch */
{
  /* ... process rows here ... */
  printf("Number of rows returned: %lu\n",
         (unsigned long) mysql_num_rows(result));
  mysql_free_result(result);
}
else        /* there is no result set */
{
  if (mysql_field_count(mysql) == 0)
  {
    printf("Number of rows affected: %lu\n",
```

```
            (unsigned long) mysql_affected_rows(mysql));
  }
  else      /* an error occurred */
  {
    fprintf(stderr, "Error %u: %s\n",
             mysql_errno(mysql), mysql_error(mysql));
  }
}

/* extract any available session state-change information */
enum enum_session_state_type type;
for (type = SESSION_TRACK_BEGIN; type <= SESSION_TRACK_END; type++)
{
  const char *data;
  size_t length;

  if (mysql_session_track_get_first(mysql, type, &data, &length) == 0)
  {
    printf("Type=%d:\n", type);
    printf("mysql_session_track_get_first() returns: %*.*s\n",
            (int) length, (int) length, data);

    /* check for more data */
    while (mysql_session_track_get_next(mysql, type, &data, &length) == 0)
    {
      printf("mysql_session_track_get_next() returns: %*.*s\n",
              (int) length, (int) length, data);
    }
  }
}
```

27.7.7.69 mysql_session_track_get_next()

```
int mysql_session_track_get_next(MYSQL *mysql, enum enum_session_state_type
type, const char **data, size_t *length)
```

Description

This function fetches session state-change information received from the server, following that retrieved by `mysql_session_track_get_first()`.

Following a successful call to `mysql_session_track_get_first()`, call `mysql_session_track_get_next()` repeatedly until it returns nonzero to indicate no more information is available. The calling sequence for `mysql_session_track_get_next()` is similar to that for `mysql_session_track_get_first()`. For more information and an example that demonstrates both functions, see Section 27.7.7.68, “mysql_session_track_get_first()”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

27.7.7.70 mysql_set_character_set()

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

Return Values

Zero for success. Nonzero if an error occurred.

Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
          mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
           mysql_character_set_name(&mysql));
}
```

27.7.7.71 mysql_set_local_infile_default()

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the `LOAD DATA LOCAL INFILE` callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

Return Values

None.

Errors

None.

27.7.7.72 mysql_set_local_infile_handler()

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)
(void **, const char *, void *), int (*local_infile_read)(void *, char *,
unsigned int), void (*local_infile_end)(void *), int (*local_infile_error)
(void *, char*, unsigned int), void *userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the

pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

Make the initialization function return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data is stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. Within this function, deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
                   char *error_msg,
                   unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message is written, and `error_msg_len` is the length of the buffer. Write the message as a null-terminated string, at most `error_msg_len`−1 bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

Return Values

None.

Errors

None.

27.7.7.73 mysql_set_server_option()

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values.

Option	Description
MYSQL_OPTION_MULTI_STATEMENTS_ON	Enable multiple-statement support
MYSQL_OPTION_MULTI_STATEMENTS_OFF	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to mysql_query() or mysql_real_query() by using a loop that calls mysql_next_result() to determine whether there are more results. For an example, see Section 27.7.19, “C API Multiple Statement Execution Support”.

Enabling multiple-statement support with MYSQL_OPTION_MULTI_STATEMENTS_ON does not have quite the same effect as enabling it by passing the CLIENT_MULTI_STATEMENTS flag to mysql_real_connect(): CLIENT_MULTI_STATEMENTS also enables CLIENT_MULTI_RESULTS. If you are using the CALL SQL statement in your programs, multiple-result support must be enabled; this means that MYSQL_OPTION_MULTI_STATEMENTS_ON by itself is insufficient to permit the use of CALL.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

- CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

- CR_SERVER_LOST

  The connection to the server was lost during the query.

- ER_UNKNOWN_COM_ERROR

  The server did not support mysql_set_server_option() (which is the case that the server is older than 4.1.1) or the server did not support the option one tried to set.

27.7.7.74 mysql_shutdown()

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level
shutdown_level)
```

Description

Note

mysql_shutdown() is deprecated and will be removed in a future version of MySQL. Instead, use mysql_query() to execute a SHUTDOWN statement.

Asks the database server to shut down. The connected user must have the SHUTDOWN privilege. MySQL servers support only one type of shutdown; shutdown_level must be equal to SHUTDOWN_DEFAULT. Dynamically linked executables which have been compiled with older versions of the libmysqlclient headers and call mysql_shutdown() need to be used with the old libmysqlclient dynamic library.

An alternative to mysql_shutdown() is to use the SHUTDOWN SQL statement.

The shutdown process is described in Section 5.1.12, “The Server Shutdown Process”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.75 mysql_sqlstate()

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. `'00000'` means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, *Errors, Error Codes, and Common Problems*.

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See Section 27.7.7.14, “mysql_errno()”, Section 27.7.7.15, “mysql_error()”, and Section 27.7.11.27, “mysql_stmt_sqlstate()”.

27.7.7.76 mysql_ssl_set()

```
bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const
char *ca, const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing encrypted connections using SSL. The `mysql` argument must be a valid connection handler. Any unused SSL arguments may be given as `NULL`.

If used, `mysql_ssl_set()` must be called before `mysql_real_connect()`. `mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

It is optional to call `mysql_ssl_set()` to obtain an encrypted connection because by default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.4.1, “Configuring MySQL to Use Encrypted Connections”). `mysql_ssl_set()` may be useful to applications that must specify particular certificate and key files, encryption ciphers, and so forth.

`mysql_ssl_set()` specifies SSL information such as certificate and key files for establishing an encrypted connection if such connections are available, but does not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 27.7.18, “C API Encrypted Connection Support”.

`mysql_ssl_set()` is a convenience function that is essentially equivalent to this set of `mysql_options()` calls:

```
mysql_options(mysql, MYSQL_OPT_SSL_KEY,    key);
mysql_options(mysql, MYSQL_OPT_SSL_CERT,   cert);
mysql_options(mysql, MYSQL_OPT_SSL_CA,     ca);
mysql_options(mysql, MYSQL_OPT_SSL_CAPATH, capath);
mysql_options(mysql, MYSQL_OPT_SSL_CIPHER, cipher);
```

Because of that equivalence, applications can, instead of calling `mysql_ssl_set()`, call `mysql_options()` directly, omitting calls for those options for which the option value is `NULL`. Moreover, `mysql_options()` offers encrypted-connection options not available using `mysql_ssl_set()`, such as `MYSQL_OPT_SSL_MODE` to specify the security state of the connection, and `MYSQL_OPT_TLS_VERSION` to specify the protocols permitted by the client for encrypted connections.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `key`: The path name to the key file
- `cert`: The path name to the certificate file
- `ca`: The path name to the certificate authority file
- `capath`: The path name to a directory that contains trusted SSL CA certificates in PEM format
- `cipher`: A list of permissible ciphers to use for SSL encryption

Return Values

This function always returns `0`. If SSL setup is incorrect, a subsequent `mysql_real_connect()` call returns an error when you attempt to connect.

27.7.7.77 mysql_stat()

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.78 mysql_store_result()

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You need not call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 27.7.19, “C API Multiple Statement Execution Support”.

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 27.7.7.22, “mysql_field_count()”.

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement did not return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that is not a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See Section 27.7.25.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.7.79 mysql_thread_id()

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Note

This function does not work correctly if thread IDs become larger than 32 bits, which can occur on some systems. To avoid problems with `mysql_thread_id()`, do not use it. To get the connection ID, execute a `SELECT CONNECTION_ID()` query and retrieve the result.

Return Values

The thread ID of the current connection.

Errors

None.

27.7.7.80 mysql_use_result()

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you should not use `mysql_use_result()` for locking reads if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

27.7.7.81 mysql_warning_count()

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of errors, warnings, and notes generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

27.7.8 C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handler returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

For a list of SQL statements that can be used as prepared statements, see Section 13.5, “Prepared SQL Statement Syntax”.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

27.7.9 C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handler, pass a `MYSQL` connection handler to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the `MYSQL_STMT` pointer and the statement string to `mysql_stmt_prepare()`.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.

- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see Section 27.7.11.10, “mysql_stmt_execute()”, and Section 27.7.11.11, “mysql_stmt_fetch()”.

- `MYSQL_STMT`

  This structure is a handler for a prepared statement. A handler is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handler is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

  The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

  Multiple statement handlers can be associated with a single connection. The limit on the number of handlers depends on the available system resources.

- `MYSQL_BIND`

  This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

  - For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
  - For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.

  To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

  The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

  - `enum enum_field_types buffer_type`

    The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see Section 27.7.9.1, “C API Prepared Statement Type Codes”.

  - `void *buffer`

    A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

    For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL use the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

    For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

- For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.
- For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.
- For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

For guidelines about mapping between C types and SQL types and notes about type conversions, see Section 27.7.9.1, “C API Prepared Statement Type Codes”, and Section 27.7.9.2, “C API Prepared Statement Type Conversions”.

- `unsigned long buffer_length`

  The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

  A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data.

  For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

  For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

  - If the return value is 0, `*length` indicates the actual length of the parameter value.
  - If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

  `length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

  If you must determine the length of a returned value before fetching it, see Section 27.7.11.11, “mysql_stmt_fetch()”, for some strategies.

- `bool *is_null`

  This member points to a `bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

  `is_null` is a *pointer* to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify `NULL` values:

  - If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other `MYSQL_BIND` members, including `is_null`, do not matter.

- If your data values are always `NOT NULL`, set `is_null = (bool*) 0`, and set the other members appropriately for the variable you are binding.
- In all other cases, set the other members appropriately and set `is_null` to the address of a `bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is `NULL` or `NOT NULL`, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by `is_null` to true or false according to whether the result set column value returned from the statement is or is not `NULL`.

- `bool is_unsigned`

  This member applies for C variables with data types that can be `unsigned` (`char`, `short int`, `int`, `long long int`). Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

  `is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `bool *error`

  For output, set this member to point to a `bool` variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer` member to point to a `MYSQL_TIME` structure, and set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`).

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
`unsigned int year`	The year
`unsigned int month`	The month of the year
`unsigned int day`	The day of the month
`unsigned int hour`	The hour of the day
`unsigned int minute`	The minute of the hour
`unsigned int second`	The second of the minute
`bool neg`	A boolean flag indicating whether the time is negative

Member	Description
`unsigned long second_part`	The fractional part of the second in microseconds

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See Section 27.7.20, "C API Prepared Statement Handling of Date and Time Values".

27.7.9.1 C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

Input Variable C Type	`buffer_type` Value	SQL Type of Destination Value
`signed char`	`MYSQL_TYPE_TINY`	`TINYINT`
`short int`	`MYSQL_TYPE_SHORT`	`SMALLINT`
`int`	`MYSQL_TYPE_LONG`	`INT`
`long long int`	`MYSQL_TYPE_LONGLONG`	`BIGINT`
`float`	`MYSQL_TYPE_FLOAT`	`FLOAT`
`double`	`MYSQL_TYPE_DOUBLE`	`DOUBLE`
`MYSQL_TIME`	`MYSQL_TYPE_TIME`	`TIME`
`MYSQL_TIME`	`MYSQL_TYPE_DATE`	`DATE`
`MYSQL_TIME`	`MYSQL_TYPE_DATETIME`	`DATETIME`
`MYSQL_TIME`	`MYSQL_TYPE_TIMESTAMP`	`TIMESTAMP`
`char[]`	`MYSQL_TYPE_STRING`	`TEXT`, `CHAR`, `VARCHAR`
`char[]`	`MYSQL_TYPE_BLOB`	`BLOB`, `BINARY`, `VARBINARY`
	`MYSQL_TYPE_NULL`	`NULL`

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in Section 27.7.9, "C API Prepared Statement Data Structures".

For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.
- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the `binary` character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the

recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

SQL Type of Received Value	`buffer_type` Value	Output Variable C Type
`TINYINT`	`MYSQL_TYPE_TINY`	`signed char`
`SMALLINT`	`MYSQL_TYPE_SHORT`	`short int`
`MEDIUMINT`	`MYSQL_TYPE_INT24`	`int`
`INT`	`MYSQL_TYPE_LONG`	`int`
`BIGINT`	`MYSQL_TYPE_LONGLONG`	`long long int`
`FLOAT`	`MYSQL_TYPE_FLOAT`	`float`
`DOUBLE`	`MYSQL_TYPE_DOUBLE`	`double`
`DECIMAL`	`MYSQL_TYPE_NEWDECIMAL`	`char[]`
`YEAR`	`MYSQL_TYPE_SHORT`	`short int`
`TIME`	`MYSQL_TYPE_TIME`	`MYSQL_TIME`
`DATE`	`MYSQL_TYPE_DATE`	`MYSQL_TIME`
`DATETIME`	`MYSQL_TYPE_DATETIME`	`MYSQL_TIME`
`TIMESTAMP`	`MYSQL_TYPE_TIMESTAMP`	`MYSQL_TIME`
`CHAR`, `BINARY`	`MYSQL_TYPE_STRING`	`char[]`
`VARCHAR`, `VARBINARY`	`MYSQL_TYPE_VAR_STRING`	`char[]`
`TINYBLOB`, `TINYTEXT`	`MYSQL_TYPE_TINY_BLOB`	`char[]`
`BLOB`, `TEXT`	`MYSQL_TYPE_BLOB`	`char[]`
`MEDIUMBLOB`, `MEDIUMTEXT`	`MYSQL_TYPE_MEDIUM_BLOB`	`char[]`
`LONGBLOB`, `LONGTEXT`	`MYSQL_TYPE_LONG_BLOB`	`char[]`
`BIT`	`MYSQL_TYPE_BIT`	`char[]`

27.7.9.2 C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string `'255\0'`.

- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[]`. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

  ```
  SELECT bit_col + 0 FROM t
  SELECT CAST(bit_col AS UNSIGNED) FROM t
  ```

  To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in Section 27.7.11.23, “mysql_stmt_result_metadata()”, and Section 27.7.5, “C API Data Structures”.

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see Section 27.7.5, “C API Data Structures”). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

27.7.10 C API Prepared Statement Function Overview

The following table summarizes the functions available for prepared statement processing. For greater detail, see the descriptions in Section 27.7.11, “C API Prepared Statement Function Descriptions”.

Function	Description
`mysql_stmt_affected_rows()`	Returns the number of rows changed, deleted, or inserted by prepared `UPDATE`, `DELETE`, or `INSERT` statement
`mysql_stmt_attr_get()`	Gets value of an attribute for a prepared statement
`mysql_stmt_attr_set()`	Sets an attribute for a prepared statement
`mysql_stmt_bind_param()`	Associates application data buffers with the parameter markers in a prepared SQL statement

Function	Description
mysql_stmt_bind_result()	Associates application data buffers with columns in a result set
mysql_stmt_close()	Frees memory used by a prepared statement
mysql_stmt_data_seek()	Seeks to an arbitrary row number in a statement result set
mysql_stmt_errno()	Returns the error number for the last statement execution
mysql_stmt_error()	Returns the error message for the last statement execution
mysql_stmt_execute()	Executes a prepared statement
mysql_stmt_fetch()	Fetches the next row of data from a result set and returns data for all bound columns
mysql_stmt_fetch_column()	Fetch data for one column of the current row of a result set
mysql_stmt_field_count()	Returns the number of result columns for the most recent statement
mysql_stmt_free_result()	Free the resources allocated to a statement handler
mysql_stmt_init()	Allocates memory for a MYSQL_STMT structure and initializes it
mysql_stmt_insert_id()	Returns the ID generated for an AUTO_INCREMENT column by a prepared statement
mysql_stmt_next_result()	Returns/initiates the next result in a multiple-result execution
mysql_stmt_num_rows()	Returns the row count from a buffered statement result set
mysql_stmt_param_count()	Returns the number of parameters in a prepared statement
mysql_stmt_param_metadata()	(Return parameter metadata in the form of a result set) This function does nothing
mysql_stmt_prepare()	Prepares an SQL statement string for execution
mysql_stmt_reset()	Resets the statement buffers in the server
mysql_stmt_result_metadata()	Returns prepared statement metadata in the form of a result set
mysql_stmt_row_seek()	Seeks to a row offset in a statement result set, using value returned from mysql_stmt_row_tell()
mysql_stmt_row_tell()	Returns the statement row cursor position
mysql_stmt_send_long_data()	Sends long data in chunks to server
mysql_stmt_sqlstate()	Returns the SQLSTATE error code for the last statement execution
mysql_stmt_store_result()	Retrieves a complete result set to the client

Call mysql_stmt_init() to create a statement handler, then mysql_stmt_prepare() to prepare the statement string, mysql_stmt_bind_param() to supply the parameter data, and mysql_stmt_execute() to execute the statement. You can repeat the mysql_stmt_execute() by changing parameter values in the respective buffers supplied through mysql_stmt_bind_param().

You can send text or binary data in chunks to server using mysql_stmt_send_long_data(). See Section 27.7.11.26, “mysql_stmt_send_long_data()”.

If the statement is a SELECT or any other statement that produces a result set, mysql_stmt_prepare() also returns the result set metadata information in the form of a MYSQL_RES result set through mysql_stmt_result_metadata().

You can supply the result buffers using mysql_stmt_bind_result(), so that the mysql_stmt_fetch() automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handler using mysql_stmt_close() so that all resources associated with it can be freed. At that point the handler becomes invalid and should no longer be used.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handler with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handler and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare  [1] SELECT ?
Execute  [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. *`N`* is a positive integer. If there are multiple prepared statements active simultaneously for the client, *`N`* may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

27.7.11 C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handler, use the `mysql_stmt_init()` function.

27.7.11.1 mysql_stmt_affected_rows()

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See Section 27.7.7.1, “mysql_affected_rows()”.

Errors

None.

Example

See the Example in Section 27.7.11.10, “mysql_stmt_execute()”.

27.7.11.2 mysql_stmt_attr_get()

```
bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option,
void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See Section 27.7.11.3, “mysql_stmt_attr_set()”, for a list of options and option types.

Return Values

Zero for success. Nonzero if `option` is unknown.

Errors

None.

27.7.11.3 mysql_stmt_attr_set()

```
bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option,
const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
`STMT_ATTR_UPDATE_MAX_LENGTH`	`bool *`	If set to 1, causes `mysql_stmt_store_result()` to update the metadata `MYSQL_FIELD->max_length` value.
`STMT_ATTR_CURSOR_TYPE`	`unsigned long *`	Type of cursor to open for statement when `mysql_stmt_execute()` is invoked. `*arg` can be `CURSOR_TYPE_NO_CURSOR` (the default) or `CURSOR_TYPE_READ_ONLY`.
`STMT_ATTR_PREFETCH_ROWS`	`unsigned long *`	Number of rows to fetch from server at a time when using a cursor. `*arg` can be in the range from 1 to the maximum value of `unsigned long`. The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

Return Values

Zero for success. Nonzero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                         (void*) &prefetch_rows);
/* ... check return value ... */
```

27.7.11.4 mysql_stmt_bind_param()

```
bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each `?` parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

Section 27.7.9, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 27.7.11.10, “mysql_stmt_execute()”.

27.7.11.5 mysql_stmt_bind_result()

```
bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol does not return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. Section 27.7.9, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 27.7.11.11, “mysql_stmt_fetch()”.

27.7.11.6 mysql_stmt_close()

```
bool mysql_stmt_close(MYSQL_STMT *stmt)
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handler pointed to by `stmt`, which at that point becomes invalid and should no longer be used. For a failed `mysql_stmt_close()` call, do not call `mysql_stmt_error()`, or `mysql_stmt_errno()`, or `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()`, `mysql_errno()`, or `mysql_sqlstate()` instead.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 27.7.11.10, “mysql_stmt_execute()”.

27.7.11.7 mysql_stmt_data_seek()

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from `0` to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

27.7.11.8 mysql_stmt_errno()

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at Appendix B, *Errors, Error Codes, and Common Problems*.

If the failed statement API function was `mysql_stmt_close()`, do not call or `mysql_stmt_errno()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_errno()` instead.

Return Values

An error code value. Zero if no error occurred.

Errors

None.

27.7.11.9 mysql_stmt_error()

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string (`""`) is returned if no error occurred. Either of these two tests can be used to check for an error:

```
if(*mysql_stmt_errno(stmt))
{
  // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
  // an error occurred
}
```

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_error()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()` instead.

The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

27.7.11.10 mysql_stmt_execute()

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handler. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to Section 27.7.11.11, “mysql_stmt_fetch()”.

  Do not following invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handler. For an example that shows how to retrieve data, see Section 27.7.11.11, “mysql_stmt_fetch()”.

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                                     col2 VARCHAR(40),\
                                                     col3 SMALLINT,\
                                                     col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \
                       test_table(col1,col2,col3) \
                       VALUES(?,?,?)"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[3];
my_ulonglong  affected_rows;
int           param_count;
short         small_data;
int           int_data;

  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
                (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
  fprintf(stderr, " invalid affected rows by MySQL\n");
  exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
  /* mysql_stmt_close() invalidates stmt, so call          */
  /* mysql_error(mysql) rather than mysql_stmt_error(stmt) */
  fprintf(stderr, " failed while closing the statement\n");
  fprintf(stderr, " %s\n", mysql_error(mysql));
  exit(0);
}
```

Note

For complete examples on the use of prepared statement functions, refer to the file `tests/mysql_client_test.c`. This file can be obtained from a MySQL source distribution or from the source repository (see Section 2.8, “Installing MySQL from Source”).

27.7.11.11 mysql_stmt_fetch()

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
`MYSQL_TYPE_TINY`	1
`MYSQL_TYPE_SHORT`	2
`MYSQL_TYPE_LONG`	4
`MYSQL_TYPE_LONGLONG`	8
`MYSQL_TYPE_FLOAT`	4
`MYSQL_TYPE_DOUBLE`	8
`MYSQL_TYPE_TIME`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_DATE`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_DATETIME`	`sizeof(MYSQL_TIME)`
`MYSQL_TYPE_STRING`	`data length`
`MYSQL_TYPE_BLOB`	`data_length`

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.

- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```
real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
```

```
{
  data= malloc(real_length);
  bind[0].buffer= data;
  bind[0].buffer_length= real_length;
  mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling `mysql_stmt_errno()` and `mysql_stmt_error()`.
`MYSQL_NO_DATA`	No more rows/data exists
`MYSQL_DATA_TRUNCATED`	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

- `CR_UNSUPPORTED_PARAM_TYPE`

  The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in Section 27.7.11.10, “mysql_stmt_execute()”.) The `mysql` variable is assumed to be a valid connection handler.

```
#define STRING_SIZE 50

#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
                       FROM test_table"

MYSQL_STMT    *stmt;
```

```
MYSQL_BIND    bind[4];
MYSQL_RES     *prepare_meta_result;
MYSQL_TIME    ts;
unsigned long length[4];
int           param_count, column_count, row_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];
bool          is_null[4];
bool          error[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
  fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}
fprintf(stdout, " prepare, SELECT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);

if (param_count != 0) /* validate parameter count */
{
  fprintf(stderr, " invalid parameter count returned by MySQL\n");
  exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
  fprintf(stderr,
         " mysql_stmt_result_metadata(), \
           returned no meta information\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Get total columns in the query */
column_count= mysql_num_fields(prepare_meta_result);
fprintf(stdout,
        " total columns in SELECT statement: %d\n",
        column_count);

if (column_count != 4) /* validate column count */
{
  fprintf(stderr, " invalid column count returned by MySQL\n");
  exit(0);
}

/* Execute the SELECT query */
if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, " mysql_stmt_execute(), failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Bind the result buffers for all 4 columns before fetching them */

memset(bind, 0, sizeof(bind));

/* INTEGER COLUMN */
```

```
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= &is_null[0];
bind[0].length= &length[0];
bind[0].error= &error[0];

/* STRING COLUMN */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= &is_null[1];
bind[1].length= &length[1];
bind[1].error= &error[1];

/* SMALLINT COLUMN */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null[2];
bind[2].length= &length[2];
bind[2].error= &error[2];

/* TIMESTAMP COLUMN */
bind[3].buffer_type= MYSQL_TYPE_TIMESTAMP;
bind[3].buffer= (char *)&ts;
bind[3].is_null= &is_null[3];
bind[3].length= &length[3];
bind[3].error= &error[3];

/* Bind the result buffers */
if (mysql_stmt_bind_result(stmt, bind))
{
  fprintf(stderr, " mysql_stmt_bind_result() failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Now buffer all results to client (optional step) */
if (mysql_stmt_store_result(stmt))
{
  fprintf(stderr, " mysql_stmt_store_result() failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Fetch all rows */
row_count= 0;
fprintf(stdout, "Fetching results ...\n");
while (!mysql_stmt_fetch(stmt))
{
  row_count++;
  fprintf(stdout, "  row %d\n", row_count);

  /* column 1 */
  fprintf(stdout, "   column1 (integer)  : ");
  if (is_null[0])
    fprintf(stdout, " NULL\n");
  else
    fprintf(stdout, " %d(%ld)\n", int_data, length[0]);

  /* column 2 */
  fprintf(stdout, "   column2 (string)   : ");
  if (is_null[1])
    fprintf(stdout, " NULL\n");
  else
    fprintf(stdout, " %s(%ld)\n", str_data, length[1]);

  /* column 3 */
  fprintf(stdout, "   column3 (smallint) : ");
  if (is_null[2])
    fprintf(stdout, " NULL\n");
  else
    fprintf(stdout, " %d(%ld)\n", small_data, length[2]);
```

```
  /* column 4 */
  fprintf(stdout, "   column4 (timestamp): ");
  if (is_null[3])
    fprintf(stdout, " NULL\n");
  else
    fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)\n",
                    ts.year, ts.month, ts.day,
                    ts.hour, ts.minute, ts.second,
                    length[3]);
  fprintf(stdout, "\n");
}

/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
  fprintf(stderr, " MySQL failed to return all rows\n");
  exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
  /* mysql_stmt_close() invalidates stmt, so call          */
  /* mysql_error(mysql) rather than mysql_stmt_error(stmt) */
  fprintf(stderr, " failed while closing the statement\n");
  fprintf(stderr, " %s\n", mysql_error(mysql));
  exit(0);
}
```

27.7.11.12 mysql_stmt_fetch_column()

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int
column, unsigned long offset)
```

Description

Fetches one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`

  Invalid column number.

- `CR_NO_DATA`

  The end of the result set has already been reached.

27.7.11.13 mysql_stmt_field_count()

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

27.7.11.14 mysql_stmt_free_result()

```
bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero for success. Nonzero if an error occurred.

27.7.11.15 mysql_stmt_init()

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Creates and returns a `MYSQL_STMT` handler. The handler should be freed with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

See also Section 27.7.9, “C API Prepared Statement Data Structures”, for more information.

Return Values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`

  Out of memory.

27.7.11.16 mysql_stmt_insert_id()

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See Section 27.7.7.38, “mysql_insert_id()”, for more information.

Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

Errors

None.

27.7.11.17 mysql_stmt_next_result()

```
int mysql_stmt_next_result(MYSQL_STMT *mysql)
```

Description

This function is used when you use prepared `CALL` statements to execute stored procedures, which can return multiple result sets. Use a loop that calls `mysql_stmt_next_result()` to determine whether there are more results. If a procedure has `OUT` or `INOUT` parameters, their values will be returned as a single-row result set following any other result sets. The values will appear in the order in which they are declared in the procedure parameter list.

`mysql_stmt_next_result()` returns a status to indicate whether more results exist. If `mysql_stmt_next_result()` returns an error, there are no more results.

Before each call to `mysql_stmt_next_result()`, you must call `mysql_stmt_free_result()` for the current result if it produced a result set (rather than just a result status).

After calling `mysql_stmt_next_result()` the state of the connection is as if you had called `mysql_stmt_execute()`. This means that you can call `mysql_stmt_bind_result()`, `mysql_stmt_affected_rows()`, and so forth.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_stmt_next_result()` to advance to the next result.

For an example that shows how to use `mysql_stmt_next_result()`, see Section 27.7.21, “C API Prepared CALL Statement Support”.

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

27.7.11.18 mysql_stmt_num_rows()

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handler. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

27.7.11.19 mysql_stmt_param_count()

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in Section 27.7.11.10, “mysql_stmt_execute()”.

27.7.11.20 mysql_stmt_param_metadata()

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

27.7.11.21 mysql_stmt_prepare()

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long
length)
```

Description

Given the statement handler returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length`

argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (`;`) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

See the Example in Section 27.7.11.10, “mysql_stmt_execute()”.

27.7.11.22 mysql_stmt_reset()

```
bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.11.23 mysql_stmt_result_metadata()

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handler with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

See the Example in Section 27.7.11.11, “mysql_stmt_fetch()”.

27.7.11.24 mysql_stmt_row_seek()

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET
offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

27.7.11.25 mysql_stmt_row_tell()

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

27.7.11.26 mysql_stmt_send_long_data()

```
bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int
parameter_number, const char *data, unsigned long length)
```

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See Section 27.7.11.22, “mysql_stmt_reset()”.

The `max_allowed_packet` system variable controls the maximum size of parameter values that can be sent with `mysql_stmt_send_long_data()`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

  The parameter does not have a string or binary type.

- `CR_INVALID_PARAMETER_NO`

  Invalid parameter number.

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handler.

```
#define INSERT_QUERY "INSERT INTO \
                      test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long       length;
```

```
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
  fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}
 memset(bind, 0, sizeof(bind));
 bind[0].buffer_type= MYSQL_TYPE_STRING;
 bind[0].length= &length;
 bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
  fprintf(stderr, "\n param bind failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Supply data in chunks to server */
 if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
  fprintf(stderr, "\n send_long_data failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Supply the next piece of data */
 if (mysql_stmt_send_long_data(stmt,0,
          " - The most popular Open Source database",40))
{
  fprintf(stderr, "\n send_long_data failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}

 /* Now, execute the query */
 if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, "\n mysql_stmt_execute failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}
```

27.7.11.27 mysql_stmt_sqlstate()

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. `"00000"` means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, *Errors, Error Codes, and Common Problems*.

Not all MySQL errors are mapped to SQLSTATE codes. The value `"HY000"` (general error) is used for unmapped errors.

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_sqlstate()` instead.

Return Values

A null-terminated character string containing the SQLSTATE error code.

27.7.11.28 mysql_stmt_store_result()

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by calling `mysql_stmt_execute()` to executed prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see Section 27.7.11.11, “mysql_stmt_fetch()”.)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to Section 27.7.11.23, “mysql_stmt_result_metadata()”.

Note

MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See Section 27.7.11.3, “mysql_stmt_attr_set()”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

  Out of memory.

- `CR_SERVER_GONE_ERROR`

  The MySQL server has gone away.

- `CR_SERVER_LOST`

  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

  An unknown error occurred.

27.7.12 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also Section 27.7.4.3, “Writing C API Threaded Client Programs”.

27.7.12.1 mysql_thread_end()

```
void mysql_thread_end(void)
```

Description

Call this function before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` *is not invoked automatically by the client library*.

- For release/production builds without debugging support enabled, `mysql_thread_end()` need not be called.
- For debug builds, `mysql_thread_init()` allocates debugging information for the DBUG package (see Section 28.5.3, “The DBUG Package”). `mysql_thread_end()` must be called for each `mysql_thread_init()` call to avoid a memory leak.

Return Values

None.

27.7.12.2 mysql_thread_init()

```
bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: calling `mysql_thread_init()` is automatically handled by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` is called for you.

Return Values

Zero for success. Nonzero if an error occurred.

27.7.12.3 mysql_thread_safe()

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

27.7.13 C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the `st_mysql_client_plugin` structure used by these functions, see Client Plugin Descriptors.

It is unlikely that a client program needs to call the functions in this section. For example, a client that supports the use of authentication plugins normally causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

27.7.13.1 mysql_client_find_plugin()

```
struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const
char *name, int type)
```

Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The plugin name.
- `type`: The plugin type.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 27.7.7.15, “mysql_error()”, and Section 27.7.7.14, “mysql_errno()”.

Example

```
MYSQL mysql;
struct st_mysql_client_plugin *p;

if ((p = mysql_client_find_plugin(&mysql, "myplugin",
                                  MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0)))
{
  printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

27.7.13.2 mysql_client_register_plugin()

```
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql,
struct st_mysql_client_plugin *plugin)
```

Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.

- `plugin`: A pointer to the plugin structure.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 27.7.7.15, “mysql_error()”, and Section 27.7.7.14, “mysql_errno()”.

27.7.13.3 mysql_load_plugin()

```
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char
*name, int type, int argc, ...)
```

Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The name of the plugin to load.
- `type`: The type of plugin to load, or −1 to disable type checking. If type is not −1, only plugins matching the type are considered for loading.
- `argc`: The number of following arguments (0 if there are none). Interpretation of any following arguments depends on the plugin type.

Another way to cause plugins to be loaded is to set the `LIBMYSQL_PLUGINS` environment variable to a semicolon-separated list of plugin names. For example:

```
shell> export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by `LIBMYSQL_PLUGINS` are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

The `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the path name of the directory in which to look for client plugins. This variable is used in two ways:

- During client plugin preloading, the value of the `--plugin-dir` option is not available, so client plugin loading fails unless the plugins are located in the hardwired default directory. If the plugins are located elsewhere, `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the proper directory to enable plugin preloading to succeed.
- For explicit client plugin loading, the `mysql_load_plugin()` and `mysql_load_plugin_v()` C API functions use the `LIBMYSQL_PLUGIN_DIR` value if it exists and the `--plugin-dir` option was not given. If `--plugin-dir` is given, `mysql_load_plugin()` and `mysql_load_plugin_v()` ignore `LIBMYSQL_PLUGIN_DIR`.

Return Values

A pointer to the plugin if it was loaded successfully. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 27.7.7.15, “mysql_error()”, and Section 27.7.7.14, “mysql_errno()”.

Example

```
MYSQL mysql;

if(!mysql_load_plugin(&mysql, "myplugin",
                      MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0))
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

See Also

See also Section 27.7.13.3, “mysql_load_plugin()”, Section 27.7.7.15, “mysql_error()”, Section 27.7.7.14, “mysql_errno()”.

27.7.13.4 mysql_load_plugin_v()

```
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char
*name, int type, int argc, va_list args)
```

Description

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

See Also

See also Section 27.7.13.3, “mysql_load_plugin()”.

27.7.13.5 mysql_plugin_options()

```
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char
*option, const void *value)
```

Description

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- `plugin`: A pointer to the plugin structure.
- `option`: The option to be set.
- `value`: A pointer to the option value.

Return Values

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

27.7.14 C API Binary Log Interface

The MySQL client/server protocol includes a client interface for reading a stream of replication events from a MySQL server binary log. This capability uses the `MYSQL_RPL` data structure and a small set of functions to manage communication between a client program and the server from which the binary log is to be read. The following sections describe aspects of this interface in more detail.

27.7.15 C API Binary Log Data Structures

C API functions for processing a replication event stream from a server require a connection handler (a `MYSQL *` pointer) and a pointer to a `MYSQL_RPL` structure that describes the steam of replication events to read from the server binary log. For example:

```
MYSQL *mysql = mysql_real_connect(...);

MYSQL_RPL rpl;

# ... initialize MYSQL_RPL members ...

int result = mysql_binlog_open(mysql, &rpl);
```

This section describes the `MYSQL_RPL` structure members. Connection handlers are described in Section 27.7.5, “C API Data Structures”.

The applicable `MYSQL_RPL` members depend on the binary log operation to be performed:

- Before calling `mysql_binlog_open()`, the caller must set the `MYSQL_RPL` members from `file_name_length` through `flags`. In addition, if `flags` has the `MYSQL_RPL_GTID` flag set, the caller must set the members from `gtid_set_encoded_size` through `gtid_set_arg`.
- After a successful `mysql_binlog_fetch()` call, the caller examines the `size` and `buffer` members.

`MYSQL_RPL` structure member descriptions:

- `file_name_length`

  The length of the name of the binary log file to read. This member is used in conjunction with `file_name`; see the `file_name` description.

- `file_name`

  The name of the binary log file to read:

  - If `file_name` is `NULL`, the client library sets it to the empty string and sets `file_name_length` to 0.
  - If `file_name` is not `NULL`, `file_name_length` must either be the length of the name or 0. If `file_name_length` is 0, the client library sets it to the length of the name, in which case, `file_name` must be given as a null-terminated string.

  To read from the beginning of the binary log without having to know the name of the oldest binary log file, set `file_name` to `NULL` or the empty string, and `start_position` to 4.

- `start_position`

  The position at which to start reading the binary log. The position of the first event in any given binary log file is 4.

- `server_id`

  The server ID to use for identifying to the server from which the binary log is read.

- `flags`

  The union of flags that affect binary log reading, or 0 if no flags are set. These flag values are permitted:

  - `MYSQL_RPL_SKIP_HEARTBEAT`

Set this flag to cause `mysql_binlog_fetch()` to skip heartbeat events.

- `MYSQL_RPL_GTID`

  Set this flag to read GTID (global transaction ID) data. If set, you must initialize the `MYSQL_RPL` structure GTID-related members from `gtid_set_encoded_size` to `gtid_set_arg` before calling `mysql_binlog_open()`.

  It is beyond the scope of this documentation to describe in detail how client programs use those GTID-related members. For more information, examine the `mysqlbinlog.cc` source file. For information about GTID-based replication, see Section 18.1.3, “Replication with Global Transaction Identifiers”.

- `gtid_set_encoded_size`

  The size of GTID set data, or 0.

- `fix_gtid_set`

  The address of a callback function for `mysql_binlog_open()` to call to fill the command packet GTID set, or `NULL` if there is no such function. The callback function, if used, should have this calling signature:

```
void my_callback(MYSQL_RPL *rpl, unsigned char *packet_gtid_set);
```

- `gtid_set_arg`

  Either a pointer to GTID set data (if `fix_gtid_set` is `NULL`), or a pointer to a value to be made available for use within the callback function (if `fix_gtid_set` is not `NULL`). `gtid_set_arg` is a generic pointer, so it can point to any kind of value (for example, a string, a structure, or a function). Its interpretation within the callback depends on how the callback intends to use it.

- `size`

  After a successful `mysql_binlog_fetch()` call, the size of the returned binary log event. The value is 0 for an EOF event, greater than 0 for a non-EOF event.

- `buffer`

  After a successful `mysql_binlog_fetch()` call, a pointer to the binary log event contents.

27.7.16 C API Binary Log Function Overview

The following table summarizes the functions available for reading a replication event stream from a binary log. For greater detail, see the descriptions in Section 27.7.17, “C API Binary Log Function Descriptions”.

Function	Description
`mysql_binlog_close()`	Close replication event stream
`mysql_binlog_fetch()`	Read event from replication event stream
`mysql_binlog_open()`	Open replication event stream

27.7.17 C API Binary Log Function Descriptions

The following sections provide detailed descriptions of the functions that enable reading the stream of replication events from a MySQL server binary log.

The following simple example program demonstrates the binary log C API functions. Program notes:

- `mysql` is assumed to be a valid connection handler.
- The initial `SET` statement sets the `@master_binlog_checksum` user-defined variable that the server takes as an indication that the client is checksum-aware. This client does nothing with checksums, but without this statement, a server that includes checksums in binary log events will return an error for the first attempt to read an event containing a checksum. The value assigned to the variable is immaterial; what matters is that the variable exist. existence.

```
if (mysql_query(mysql, "SET @master_binlog_checksum='ALL'"))
{
  fprintf(stderr, "mysql_query() failed\n");
  fprintf(stderr, "Error %u: %s\n",
          mysql_errno(mysql), mysql_error(mysql));
  exit(1);
}

MYSQL_RPL rpl;

rpl.file_name_length = 0;
rpl.file_name = NULL;
rpl.start_position = 4;
rpl.server_id = 0;
rpl.flags = 0;

if (mysql_binlog_open(mysql, &rpl))
{
  fprintf(stderr, "mysql_binlog_open() failed\n");
  fprintf(stderr, "Error %u: %s\n",
          mysql_errno(mysql), mysql_error(mysql));
  exit(1);
}
for (;;)  /* read events until error or EOF */
{
  if (mysql_binlog_fetch(mysql, &rpl))
  {
    fprintf(stderr, "mysql_binlog_fetch() failed\n");
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
    break;
  }
  if (rpl.size == 0)  /* EOF */
  {
    fprintf(stderr, "EOF event received\n");
    break;
  }
  fprintf(stderr, "Event received of size %lu.\n", rpl.size);
}
mysql_binlog_close(mysql, &rpl);
```

For additional examples that show how to use these functions, look in a MySQL source distribution for these source files:

- `mysqlbinlog.cc` in the `client` directory
- `mysql_client_test.c` in the `testclients` directory

27.7.17.1 mysql_binlog_close()

```
void mysql_binlog_close(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Close a replication event stream.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`. The handler remains open after the `mysql_binlog_close()` call.

- `rpl`: The replication stream structure. After calling `mysql_binlog_close()`, this structure should not be used further without reinitializing it and calling `mysql_binlog_open()` again.

Errors

None.

Example

See Section 27.7.17, “C API Binary Log Function Descriptions”.

27.7.17.2 mysql_binlog_fetch()

```
int mysql_binlog_fetch(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Fetch one event from the replication event stream.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: The replication stream structure. After a successful call, the `size` member indicates the event size, which is 0 for an EOF event. For a non-EOF event, `size` is greater than 0 and the `buffer` member points to the event contents.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

Example

See Section 27.7.17, “C API Binary Log Function Descriptions”.

27.7.17.3 mysql_binlog_open()

```
int mysql_binlog_open(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Open a new replication event stream, to read a MySQL server binary log.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: A `MYSQL_RPL` structure that has been initialized to indicate the replication event stream source. For a description of the structure members and how to initialize them, see Section 27.7.15, “C API Binary Log Data Structures”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_FILE_NAME_TOO_LONG`

  The specified binary log file name was too long.

- `CR_OUT_OF_MEMORY`

  Out of memory.

Example

See Section 27.7.17, “C API Binary Log Function Descriptions”.

27.7.18 C API Encrypted Connection Support

This section describes how C applications use the C API capabilities for encrypted connections. By default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.4.1, “Configuring MySQL to Use Encrypted Connections”). For applications that require control beyond the default behavior over how encrypted connections are established, the C API provides these capabilities:

- The `mysql_options()` function enables applications to set the appropriate SSL/TLS options before calling `mysql_real_connect()`. For example, to require the use of an encrypted connection, see Enforcing an Encrypted Connection.
- The `mysql_get_ssl_cipher()` function enables applications to determine, after a connection has been established, whether the connection uses encryption. A `NULL` return value indicates that encryption is not being used. A non-`NULL` return value indicates an encrypted connection and names the encryption cipher. See Section 27.7.7.34, “mysql_get_ssl_cipher()”.

C API Options for Encrypted Connections

`mysql_options()` provides the following options for control over use of encrypted connections. For option details, see Section 27.7.7.50, “mysql_options()”.

- `MYSQL_OPT_SSL_CA`: The path name of the certificate authority file
- `MYSQL_OPT_SSL_CAPATH`: The path name of the certificate authority directory
- `MYSQL_OPT_SSL_CERT` The path name of the certificate file
- `MYSQL_OPT_SSL_CIPHER`: A list of permissible ciphers to use for SSL encryption.
- `MYSQL_OPT_SSL_CRL`: The path name of the certificate revocation lists file
- `MYSQL_OPT_SSL_CRLPATH`: The path name of the certificate revocation lists directory
- `MYSQL_OPT_SSL_KEY`: The path name of the key file
- `MYSQL_OPT_SSL_MODE`: The connection security state
- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT`: Whether to verify server Common Name value
- `MYSQL_OPT_TLS_VERSION`: The encryption protocols permitted by the client

`mysql_ssl_set()` can be used as a convenience routine that is equivalent to a set of `mysql_options()` calls that specify certificate and key files, encryption ciphers, and so forth. See Section 27.7.7.76, “mysql_ssl_set()”.

Enforcing an Encrypted Connection

`mysql_options()` options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the following technique:

1. Call `mysql_options()` to supply the appropriate SSL values (certificate and key files, encryption ciphers, and so forth).
2. Call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_REQUIRED` or one of the more-restrictive option values.

3. Call `mysql_real_connect()` to connect to the server. The call fails if an encrypted connection cannot be obtained; exit with an error.

27.7.19 C API Multiple Statement Execution Support

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL also supports the execution of a string containing multiple statements separated by semicolon (`;`) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

  In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handlers are defined to work only with strings that contain a single statement. See Section 27.7.8, “C API Prepared Statements”.

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:

  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`. `CLIENT_MULTI_RESULTS` is enabled by default.

  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.

- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
  printf("mysql_real_connect() failed\n");
  mysql_close(mysql);
  exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
                     "DROP TABLE IF EXISTS test_table;\
                      CREATE TABLE test_table(id INT);\
                      INSERT INTO test_table VALUES(10);\
                      UPDATE test_table SET id=20 WHERE id=10;\
                      SELECT * FROM test_table;\
                      DROP TABLE test_table");
if (status)
{
  printf("Could not execute statement(s)");
  mysql_close(mysql);
  exit(0);
}

/* process each statement result */
do {
  /* did current statement return data? */
  result = mysql_store_result(mysql);
  if (result)
  {
    /* yes; process rows and free the result set */
    process_result_set(mysql, result);
    mysql_free_result(result);
  }
  else          /* no result set or error */
  {
    if (mysql_field_count(mysql) == 0)
    {
      printf("%lld rows affected\n",
             mysql_affected_rows(mysql));
```

```
    }
    else  /* some error occurred */
    {
      printf("Could not retrieve result set\n");
      break;
    }
  }
  /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
  if ((status = mysql_next_result(mysql)) > 0)
    printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);
```

27.7.20 C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in Section 27.7.9, “C API Prepared Statement Data Structures”.

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling `mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.

2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.

3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to pass.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handler.

```
MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
                           timestamp_field) VALUES(?,?,?");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  fprintf(stderr, " mysql_stmt_init(), out of memory\n");
  exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
  fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
  fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
  exit(0);
}
```

```
/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..
```

27.7.21 C API Prepared CALL Statement Support

This section describes prepared-statement support in the C API for stored procedures executed using `CALL` statements:

Stored procedures executed using prepared `CALL` statements can be used in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.
- The final values of `OUT` and `INOUT` parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the `OUT` and `INOUT` parameters in the order in which they are declared in the procedure parameter list.

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared `CALL` statements through the `PREPARE` and `EXECUTE` statements, see Section 13.2.1, “CALL Syntax”.

An application that executes a prepared `CALL` statement should use a loop that fetches a result and then invokes `mysql_stmt_next_result()` to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has `OUT` or `INOUT` parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the `SERVER_PS_OUT_PARAMS` bit is set in the `server_status` member of the `MYSQL` connection handler:

```
mysql->server_status & SERVER_PS_OUT_PARAMS
```

The following example uses a prepared `CALL` statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of `OUT` and `INOUT` parameters. The procedure takes parameters of all three types (`IN`, `OUT`, `INOUT`), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

- One result set from a `SELECT` that displays the initial parameter values: `10`, `NULL`, `30`. (The `OUT` parameter is assigned a value by the caller, but this assignment is expected to be ineffective: `OUT` parameters are seen as `NULL` within a procedure until assigned a value within the procedure.)

- One result set from a `SELECT` that displays the modified parameter values: `100`, `200`, `300`.
- One result set containing the final `OUT` and `INOUT` parameter values: `200`, `300`.
- A final status packet.

The code to execute the procedure:

```
MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3];  /* input parameter buffers */
int        int_data[3];   /* input/output values */
bool       is_null[3];    /* output value nullability */
int        status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);

status = mysql_query(mysql,
  "CREATE PROCEDURE p1("
  "  IN p_in INT, "
  "  OUT p_out INT, "
  "  INOUT p_inout INT) "
  "BEGIN "
  "  SELECT p_in, p_out, p_inout; "
  "  SET p_in = 100, p_out = 200, p_inout = 300; "
  "  SELECT p_in, p_out, p_inout; "
  "END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  printf("Could not initialize statement\n");
  exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL p1(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));

ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;

ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;

ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0]= 10;  /* p_in */
int_data[1]= 20;  /* p_out */
int_data[2]= 30;  /* p_inout */

status = mysql_stmt_execute(stmt);
test_stmt_error(stmt, status);

/* process results until there are no more */
```

```
do {
  int i;
  int num_fields;       /* number of columns in result */
  MYSQL_FIELD *fields;  /* for result set metadata */
  MYSQL_BIND *rs_bind;  /* for output buffers */

  /* the column count is > 0 if there is a result set */
  /* 0 if the result is only the final status packet */
  num_fields = mysql_stmt_field_count(stmt);

  if (num_fields > 0)
  {
    /* there is a result set to fetch */
    printf("Number of columns in result: %d\n", (int) num_fields);

    /* what kind of result set is this? */
    printf("Data: ");
    if(mysql->server_status & SERVER_PS_OUT_PARAMS)
      printf("this result set contains OUT/INOUT parameters\n");
    else
      printf("this result set is produced by the procedure\n");

    MYSQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
    test_stmt_error(stmt, rs_metadata == NULL);

    fields = mysql_fetch_fields(rs_metadata);

    rs_bind = (MYSQL_BIND *) malloc(sizeof (MYSQL_BIND) * num_fields);
    if (!rs_bind)
    {
      printf("Cannot allocate output buffers\n");
      exit(1);
    }
    memset(rs_bind, 0, sizeof (MYSQL_BIND) * num_fields);

    /* set up and bind result set output buffers */
    for (i = 0; i < num_fields; ++i)
    {
      rs_bind[i].buffer_type = fields[i].type;
      rs_bind[i].is_null = &is_null[i];

      switch (fields[i].type)
      {
        case MYSQL_TYPE_LONG:
          rs_bind[i].buffer = (char *) &(int_data[i]);
          rs_bind[i].buffer_length = sizeof (int_data);
          break;

        default:
          fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
          exit(1);
      }
    }

    status = mysql_stmt_bind_result(stmt, rs_bind);
    test_stmt_error(stmt, status);

    /* fetch and display result set rows */
    while (1)
    {
      status = mysql_stmt_fetch(stmt);

      if (status == 1 || status == MYSQL_NO_DATA)
        break;

      for (i = 0; i < num_fields; ++i)
      {
        switch (rs_bind[i].buffer_type)
        {
          case MYSQL_TYPE_LONG:
            if (*rs_bind[i].is_null)
              printf(" val[%d] = NULL;", i);
```

```
            else
              printf(" val[%d] = %ld;",
                     i, (long) *((int *) rs_bind[i].buffer));
            break;

          default:
            printf("  unexpected type (%d)\n",
              rs_bind[i].buffer_type);
        }
      }
      printf("\n");
    }

    mysql_free_result(rs_metadata); /* free metadata */
    free(rs_bind);                  /* free output buffers */
  }
  else
  {
    /* no columns = final status packet */
    printf("End of procedure output\n");
  }

  /* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
  status = mysql_stmt_next_result(stmt);
  if (status > 0)
    test_stmt_error(stmt, status);
} while (status == 0);

mysql_stmt_close(stmt);
```

Execution of the procedure should produce the following output:

```
Number of columns in result: 3
Data: this result set is produced by the procedure
 val[0] = 10; val[1] = NULL; val[2] = 30;
Number of columns in result: 3
Data: this result set is produced by the procedure
 val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
 val[0] = 200; val[1] = 300;
End of procedure output
```

The code uses two utility routines, `test_error()` and `test_stmt_error()`, to check for errors and terminate after printing diagnostic information if an error occurred:

```
static void test_error(MYSQL *mysql, int status)
{
  if (status)
  {
    fprintf(stderr, "Error: %s (errno: %d)\n",
            mysql_error(mysql), mysql_errno(mysql));
    exit(1);
  }
}

static void test_stmt_error(MYSQL_STMT *stmt, int status)
{
  if (status)
  {
    fprintf(stderr, "Error: %s (errno: %d)\n",
            mysql_stmt_error(stmt), mysql_stmt_errno(stmt));
    exit(1);
  }
}
```

27.7.22 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with `MIN(*number-with-zerofill*)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by `;` characters).
- The capabilities of prepared `CALL` statements are described in Section 27.7.21, “C API Prepared CALL Statement Support”.

27.7.23 C API Optional Result Set Metadata

When a client executes a statement that produces a result set, MySQL by default makes available both the data the result set contains, and result set metadata that provides information about the result set data. Metadata is contained in the `MYSQL_FIELD` structure (see Section 27.7.5, “C API Data Structures”), which is returned by the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions.

As of MySQL 8.0.3, clients can indicate on a per-connection basis that result set metadata is optional and that the client will indicate to the server whether to return it. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each.

There are two ways to indicate that result set metadata is optional for a connection. They are equivalent, so either one suffices:

- At connect time, enable the `CLIENT_OPTIONAL_RESULTSET_METADATA` flag for the `client_flag` argument of `mysql_real_connect()`.
- Prior to connect time, enable the `MYSQL_OPT_OPTIONAL_RESULTSET_METADATA` option for `mysql_options()`.

For metadata-optional connections, the client sets the `resultset_metadata` system variable to control whether the server returns result set metadata. Permitted values are `FULL` (return all metadata; this is the default) and `NONE` (return no metadata).

For metadata-optional connections, the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions return `NULL` when the `resultset_metadata` system variable is set to `NONE`.

To check whether a result set has metadata, use the `mysql_result_metadata()` function. This function returns `RESULTSET_METADATA_FULL` or `RESULTSET_METADATA_NONE` to indicate that the result set has full metadata or no metadata, respectively.

`mysql_result_metadata()` can be useful if the client does not know in advance whether a result set has metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the `resultset_metadata` system variable, the client can invoke `mysql_result_metadata()` for each result set to determine whether it has metadata.

For connections that are not metadata-optional, setting `resultset_metadata` to `NONE` produces an error.

27.7.24 C API Automatic Reconnection Control

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

Auto-reconnect is disabled by default.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure that auto-reconnect is disabled. To ensure this, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

If the connection has gone down, the effect of `mysql_ping()` depends on the auto-reconnect state. If auto-reconnect is enabled, `mysql_ping()` performs a reconnect. Otherwise, it returns an error.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset on the server side and your application will not be notified.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.
- The association of the client with the Performance Schema `threads` table row that determines connection thread instrumentation is lost. If the client reconnects after a disconnect, the session is associated with a new row in the `threads` table and the thread monitoring state may be different. See Section 25.11.16.3, “The threads Table”.

If reconnection occurs, any SQL statement specified by calling `mysql_options()` with the `MYSQL_INIT_COMMAND` option is re-executed.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

27.7.25 C API Common Issues

27.7.25.1 Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data could not be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

27.7.25.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

  For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.

- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See Section 27.7.7.38, “mysql_insert_id()”.

- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

27.7.25.3 How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a nonmagic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
    VALUES(NULL,'text');         # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
    VALUES(LAST_INSERT_ID(),'text');  # use ID in second table
```

`mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see Section 12.14, “Information Functions”.
- For information on `mysql_insert_id()`, the function you use from within the C API, see Section 27.7.7.38, “mysql_insert_id()”.
- For information on obtaining the auto-incremented value when using Connector/J, see Retrieving `AUTO_INCREMENT` Column Values through JDBC.
- For information on obtaining the auto-incremented value when using Connector/ODBC, see Obtaining Auto-Increment Values.

27.8 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See MySQL and PHP.

27.9 MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see Section 2.11, “Perl Installation Notes”.
- For an example of reading options from option files, see Section 5.7.4, “Using Client Programs in a Multiple-Server Environment”.

- For secure coding tips, see Section 6.1.1, “Security Guidelines”.
- For debugging tips, see Section 28.5.1.4, “Debugging mysqld under gdb”.
- For some Perl-specific environment variables, see Section 4.9, “MySQL Program Environment Variables”.
- For considerations for running on OS X, see Section 2.4, “Installing MySQL on OS X”.
- For ways to quote string literals, see Section 9.1.1, “String Literals”.

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

  You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, http://dbi.perl.org/. That site hosts a general DBI mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see Section 1.6.2, “MySQL Mailing Lists”.
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, http://dbi.perl.org/.

  For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is http://www.kitebird.com/mysql-perl/.

27.10 MySQL Python API

`MySQLdb` is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See MySQL Connector/Python Developer Guide for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

27.11 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the `libmysqlclient` API library. For information on installing and using the MySQL/Ruby API, see Section 27.11.1, “The MySQL/Ruby API”.
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see Section 27.11.2, “The Ruby/MySQL API”.

For background and syntax information about the Ruby language, see Ruby Programming Language.

27.11.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysqlclient`.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

27.11.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

27.12 MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

27.13 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

28.5.3 The DBUG Package 3464

28.1 MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in Section 2.8.3, “Installing MySQL Using a Development Source Tree”. If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see Section 1.6.2, “MySQL Mailing Lists”. Many MySQL developers at Oracle Corporation are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at http://dev.mysql.com/doc/dev/mysql-server/latest/. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.8.7, “Generating MySQL Doxygen Documentation Content”.

28.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.

- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

  For information about tuning the parameters that control thread resources, see Section 8.12.4.1, "How MySQL Uses Threads for Client Connections".

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.

- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.

- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.

- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See Section 15.13, "InnoDB Startup Options and System Variables".

- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every *`val`* seconds.

- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 23.4.1, "Event Scheduler Overview".

`mysqladmin processlist` only shows the connection, replication, and event threads.

28.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at http://dev.mysql.com/doc/mysqltest/2.0/en/.

The current set of test cases does not test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.7, "How to Report Bugs or Problems".

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See Section 1.6.2, “MySQL Mailing Lists”.

28.2 The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See Section 5.6.1, “Installing and Uninstalling Plugins”.

MySQL supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at http://dev.mysql.com/doc/dev/mysql-server/latest/. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.8.7, “Generating MySQL Doxygen Documentation Content”.

Additional Resources

The book *MySQL 5.1 Plugin Development* by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

28.2.1 Types of Plugins

The plugin API enables creation of plugins that implement several capabilities:

- Storage engines
- Full-text parsers
- Daemons
- `INFORMATION_SCHEMA` tables

- Semisynchronous replication
- Auditing
- Authentication
- Password validation and strength checking
- Protocol tracing
- Query rewriting
- Secure keyring storage and retrieval

The following sections provide an overview of these plugin types.

Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see Section 16.11, “Overview of MySQL Storage Engine Architecture”.

For information on how to use the plugin API to write storage engines, see MySQL Internals: Writing a Custom Storage Engine.

Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). The built-in full-text parser is supported with `InnoDB` and `MyISAM` tables.

MySQL also has a character-based ngram full-text parser that supports Chinese, Japanese, and Korean (CJK), and a word-based MeCab parser plugin that supports Japanese, for use with `InnoDB` and `MyISAM` tables.

For full-text processing, “parsing” means extracting words (or “tokens”, in the case of an n-gram character-based parser) from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 12.9, “Full-Text Search Functions”. These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored. For more information, see Section 12.9.4, “Full-Text Stopwords”, and Section 12.9.6, “Fine-Tuning MySQL Full-Text Search”.

The plugin API enables you to use a full-text parser other than the default built-in full-text parser. For example, if you are working with Japanese, you may choose to use the MeCab full-text parser. The plugin API also enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for token accumulation). The ngram and MeCab parsers operate as replacements for the built-in full-text parser.

  You may choose to provide your own full-text parser if you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser

considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. This parsing is affected by the `innodb_ft_xxx` or `ft_xxx` system variables and the stopword list.

  One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from noncleartext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER parser_name
) ENGINE=InnoDB;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER parser_name;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see Section 28.2.4.4, “Writing Full-Text Parser Plugins”. MySQL 8.0 supports full-text plugins with `MyISAM` and `InnoDB`.

Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see Section 28.2.4.5, “Writing Daemon Plugins”.

INFORMATION_SCHEMA Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

For more information about `INFORMATION_SCHEMA` plugins, see Section 28.2.4.6, “Writing INFORMATION_SCHEMA Plugins”.

Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See Section 18.3.10, “Semisynchronous Replication”.

For more information about semisynchronous replication plugins, see Section 28.2.4.7, “Writing Semisynchronous Replication Plugins”.

Audit Plugins

The MySQL server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see Section 28.2.4.8, “Writing Audit Plugins”.

Authentication Plugins

MySQL supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See Section 6.3.10, “Pluggable Authentication”.

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See Section 6.3.11, “Proxy Users”.

For more information about authentication plugins, see Section 28.2.4.9, “Writing Authentication Plugins”.

Password-Validation Plugins

The MySQL server provides an interface for writing plugins that test passwords. Such a plugin implements two capabilities:

- Rejection of too-weak passwords in statements that assign passwords (such as `CREATE USER` and `ALTER USER` statements), and passwords given as arguments to the `PASSWORD()` function.

- Assessing the strength of potential passwords for the `VALIDATE_PASSWORD_STRENGTH()` SQL function.

For information about writing this type of plugin, see Section 28.2.4.10, “Writing Password-Validation Plugins”.

Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

For more information about protocol trace plugins, see Section 28.2.4.11, “Writing Protocol Trace Plugins”.

Query Rewrite Plugins

MySQL Server supports query rewrite plugins that can examine and possibly modify statements received by the server before the server executes them. A query rewrite plugin takes statements either before or after the server has parsed them.

A preparse query rewrite plugin has these characteristics:

- The plugin enables rewriting of SQL statements arriving at the server before the server processes them.
- The plugin receives a statement string and may return a different string.

A postparse query rewrite plugin has these characteristics:

- The plugin enables statement rewriting based on parse trees.
- The server parses each statement and passes its parse tree to the plugin, which may traverse the tree. The plugin can return the original tree to the server for further processing, or construct a different tree and return that instead.
- The plugin can use the `mysql_parser` plugin service for these purposes:
  - To activate statement digest calculation and obtain the normalized version of statements independent of whether the Performance Schema produces digests.
  - To traverse parse trees.
  - To parse statements. This is useful if the plugin constructs a new statement string from the parse tree. The plugin can have the server parse the string to produce a new tree, then return that tree as the representation of the rewritten statement.

For more information about plugin services, see Section 28.3, “MySQL Services for Components and Plugins”.

Preparse and postparse query rewrite plugins share these characteristics:

- If a query rewrite plugin is installed, the `--log-raw` option affects statement logging as follows:
  - Without `--log-raw`, the server logs the statement returned by the query rewrite plugin. This may differ from the statement as received.
  - With `--log-raw`, the server logs the original statement as received.
- If a plugin rewrites a statement, the server decides whether to write it to the binary log (and thus to any replication slaves) based on the rewritten statement, not the original statement. If a plugin rewrites only `SELECT` statements to `SELECT` statements, there is no impact on binary logging because the server does not write `SELECT` statements to the binary log.

- If a plugin rewrites a statement, the server produces a `Note` message that the client can view using `SHOW WARNINGS`. Messages have this format, where *`stmt_in`* is the original statement and *`stmt_out`* is the rewritten statement:

```
Query 'stmt_in' rewritten to 'stmt_out' by a query rewrite plugin
```

MySQL distributions include a postparse query rewrite plugin named `Rewriter`. This plugin is rule based. You can add rows to its rules table to cause `SELECT` statement rewriting. For more information, see Section 5.6.3, “The Rewriter Query Rewrite Plugin”.

Query rewrite plugins use the same API as audit plugins. For more information about audit plugins, see Section 28.2.4.8, “Writing Audit Plugins”.

Keyring Plugins

MySQL Server supports keyring plugins that enable internal server components and plugins to securely store sensitive information for later retrieval.

All MySQL distributions include a keyring plugin named `keyring_file`. See Section 6.5.4, “The MySQL Keyring”.

For more information about keyring plugins, see Section 28.2.4.12, “Writing Keyring Plugins”.

28.2.2 Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.

  Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

  Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

  Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

  A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS` statements.

- The plugin API includes versioning information.

  The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

  There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

  A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

  The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see Section 28.3, “MySQL Services for Components and Plugins”.

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

28.2.3 Plugin API Components

The server plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=`*`dir_name`* option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

28.2.4 Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become visible through the `SHOW STATUS` and `SHOW VARIABLES` statements and the corresponding `INFORMATION_SCHEMA` tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that `mysqld` must be linked dynamically.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see Section 2.8.4, “MySQL Source-Configuration Options”, and Section 2.8.5, “Dealing with Problems Compiling MySQL”.

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

28.2.4.1 Overview of Plugin Writing

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
```

```
#include <ctype.h>
#include <mysql/plugin.h>
```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see Server Plugin Library and Plugin Descriptors. In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

   For client plugins, write the client descriptor. For more information, see Client Plugin Descriptors.

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.

4. For server plugins, set up the status and system variables, if there are any.

5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see Section 28.2.4.3, “Compiling and Installing Plugin Libraries”.

6. For server plugins, register the plugin with the server. For more information, see Section 5.6.1, “Installing and Uninstalling Plugins”.

7. Test the plugin to verify that it works properly.

28.2.4.2 Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

- A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the `plugin.h` header file:

  ```
  mysql_declare_plugin(name)
   ... one or more server plugin descriptors here ...
  mysql_declare_plugin_end;
  ```

  The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

- Within the library descriptor, each general server plugin is described by a `st_mysql_plugin` structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.

- Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to

the plugin type. To provide the descriptor framework, invoke two macros from the `client_plugin.h` header file:

```
mysql_declare_client_plugin(plugin_type)
   ... members common to all client plugins ...
   ... type-specific extra members ...
mysql_end_client_plugin;
```

The plugin library also contains any interface functions referenced by the client descriptor.

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

- `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.
- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.
- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

When a client program looks for a client plugin that is in a plugin library and not built into `libmysqlclient`, it looks for a file with a base name that is the same as the plugin name. For example, if a program needs to use a client authentication plugin named `auth_xxx` on a system that uses `.so` as the library suffix, it looks in the file named `auth_xxx.so`. (On OS X, the program looks first for `auth_xxx.dylib`, then for `auth_xxx.so`.) For this reason, if a plugin library contains a client plugin, the library must have the same base name as that plugin.

The same is not true for a library that contains server plugins. The `--plugin-load` option and the `INSTALL PLUGIN` statement provide the library file name explicitly, so there need be no explicit relationship between the library name and the name of any server plugins it contains.

Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general plugin descriptor for each server plugin in the file. This section discusses how to write the library and general descriptors for server plugins.

The library descriptor must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The conventional way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
 ... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

Each server plugin must have a general descriptor that provides information to the server plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```
struct st_mysql_plugin
{
  int type;             /* the plugin type (a MYSQL_XXX_PLUGIN value)   */
  void *info;           /* pointer to type-specific plugin descriptor   */
  const char *name;     /* plugin name                                  */
  const char *author;   /* plugin author (for I_S.PLUGINS)              */
  const char *descr;    /* general descriptive text (for I_S.PLUGINS)   */
  int license;          /* the plugin license (PLUGIN_LICENSE_XXX)      */
  int (*init)(void *);  /* the function to invoke when plugin is loaded */
  int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for I_S.PLUGINS)             */
  struct st_mysql_show_var *status_vars;
  struct st_mysql_sys_var **system_vars;
  void * __reserved1;   /* reserved for dependency checking             */
  unsigned long flags;  /* flags for plugin */
};
```

The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `plugin.h`:

  ```
  /*
    The allowable types of plugins
  */
  #define MYSQL_UDF_PLUGIN              0  /* User-defined function        */
  #define MYSQL_STORAGE_ENGINE_PLUGIN   1  /* Storage Engine               */
  #define MYSQL_FTPARSER_PLUGIN         2  /* Full-text parser plugin      */
  #define MYSQL_DAEMON_PLUGIN           3  /* The daemon/raw plugin type */
  #define MYSQL_INFORMATION_SCHEMA_PLUGIN  4  /* The I_S plugin type */
  #define MYSQL_AUDIT_PLUGIN            5  /* The Audit plugin type        */
  #define MYSQL_REPLICATION_PLUGIN      6  /* The replication plugin type */
  #define MYSQL_AUTHENTICATION_PLUGIN   7  /* The authentication plugin type */
  ...
  ```

  For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.

- `name`: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

  The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- `author`: A string naming the plugin author. This can be whatever you like.

- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `license`: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.
- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin It returns zero for success and nonzero for failure.
- `version`: The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0x`*`MMNN`*, where *`MM`* and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.
- `status_vars`: A pointer to a structure for status variables associated with the plugin, or `NULL` if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

  The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that describe status variables. See Server Plugin Status and System Variables.
- `system_vars`: A pointer to a structure for system variables associated with the plugin, or `NULL` if there are no such variables. These options and system variables can be used to help initialize variables within the plugin.

  The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that describe system variables. See Server Plugin Status and System Variables.
- `__reserved1`: A placeholder for the future. It should be set to `NULL`.
- `flags`: Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of the applicable flags. These flags are available:

  ```
  #define PLUGIN_OPT_NO_INSTALL   1UL   /* Not dynamically loadable */
  #define PLUGIN_OPT_NO_UNINSTALL 2UL   /* Not dynamically unloadable */
  ```

  `PLUGIN_OPT_NO_INSTALL` indicates that the plugin cannot be loaded at runtime with the `INSTALL PLUGIN` statement. This is appropriate for plugins that must be loaded at server startup with the `--plugin-load` option. `PLUGIN_OPT_NO_UNINSTALL` indicates that the plugin cannot be unloaded at runtime with the `UNINSTALL PLUGIN` statement.

The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

For example, the descriptor information for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
```

```
  "Simple Full-Text Parser",  /* description                    */
  PLUGIN_LICENSE_GPL,         /* plugin license                 */
  simple_parser_plugin_init,  /* init function (when loaded)    */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                        */
  simple_status,              /* status variables               */
  simple_system_variables,    /* system variables               */
  NULL,
  0
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations_[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
                 builtin_ ## NAME ## _plugin_interface_version, \
                 builtin_ ## NAME ## _sizeof_struct_st_plugin, \
                 builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0,0}}
```

Note

Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
{
  MYSQL_FTPARSER_PLUGIN,      /* type                           */
  &simple_parser_descriptor,  /* descriptor                     */
  "simple_parser",            /* name                           */
  "Oracle Corporation",       /* author                         */
  "Simple Full-Text Parser",  /* description                    */
  PLUGIN_LICENSE_GPL,         /* plugin license                 */
  simple_parser_plugin_init,  /* init function (when loaded)    */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                        */
  simple_status,              /* status variables               */
  simple_system_variables,    /* system variables               */
  NULL,
  0
```

```
}
  ,{0,0,0,0,0,0,0,0,0,0,0,0}}
};
```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "Oracle Corporation",       /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  simple_parser_name,         /* name                            */
  simple_parser_author,       /* author                          */
  simple_parser_description,  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
}
mysql_declare_plugin_end;
```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
  const char *name;
  const char *author;
  const char *description;
} plugin_info;
```

```
plugin_info parser_info = {
  "simple_parser",
  "Oracle Corporation",
  "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  parser_info.name,           /* name                            */
  parser_info.author,         /* author                          */
  parser_info.description,    /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status,              /* status variables                */
  simple_system_variables,    /* system variables                */
  NULL,
  0
}
mysql_declare_plugin_end;
```

Server Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
  const char *name;
  char *value;
  enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

Table 28.1 Server Plugin Status Variable Types

Variable Type	Meaning
`SHOW_BOOL`	Pointer to a boolean variable
`SHOW_INT`	Pointer to an integer variable
`SHOW_LONG`	Pointer to a long integer variable
`SHOW_LONGLONG`	Pointer to a longlong integer variable
`SHOW_CHAR`	A string
`SHOW_CHAR_PTR`	Pointer to a string
`SHOW_ARRAY`	Pointer to another `st_mysql_show_var` array
`SHOW_FUNC`	Pointer to a function
`SHOW_DOUBLE`	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
 int flags;
 const char *name, *comment;
 int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
 void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. The following table shows the permissible flags.

  Table 28.2 Server Plugin System Variable Flags

Flag Value	Description
`PLUGIN_VAR_READONLY`	The system variable is read only
`PLUGIN_VAR_NOSYSVAR`	The system variable is not user visible at runtime
`PLUGIN_VAR_NOCMDOPT`	The system variable is not configurable from the command line
`PLUGIN_VAR_NOCMDARG`	No argument is required at the command line (typically used for boolean variables)
`PLUGIN_VAR_RQCMDARG`	An argument is required at the command line (this is the default)
`PLUGIN_VAR_OPCMDARG`	An argument is optional at the command line
`PLUGIN_VAR_MEMALLOC`	Used for string variables; indicates that memory is to be allocated for storage of the string

- `comment`: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- `check`: The check function, `NULL` for default.
- `update`: The update function, `NULL` for default.
- `default`: The variable default value.
- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.
- `blocksize`: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()`accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);
 ...
   SYSVAR(foo_var)= value;
   value= SYSVAR(foo_var);
   my_foo= value;
   value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
                         PLUGIN_VAR_NOCMDARG, "flag comment",
                         NULL, NULL, FALSE);
 ...
   if (THDVAR(thd, some_flag))
   {
     do_something();
     THDVAR(thd, some_flag)= FALSE;
   }
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[]= {
  MYSQL_SYSVAR(foo_var),
  MYSQL_SYSVAR(some_flag),
  NULL
};
mysql_declare_plugin(fooplug)
{
  MYSQL_..._PLUGIN,
  &plugin_data,
  "fooplug",
  "foo author",
  "This does foo!",
  PLUGIN_LICENSE_GPL,
  foo_init,
  foo_fini,
  0x0001,
  NULL,
  my_plugin_vars,
  NULL,
  0
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `bool`, which is a 1-byte boolean. (0 = `false`, 1 = `true`)

  ```
  MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
  ```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

  ```
  ```

```
MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
```

- Integer system variables, of which there are several varieties.
  - An `int` system variable, which is typically a 4-byte signed word.

```
MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

  - An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```
MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

  - A `long` system variable, which is typically either a 4- or 8-byte signed word.

```
MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

  - An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```
MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
                   minimum, maximum, blocksize)
```

  - A `long long` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
```

  - An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```
MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
```

  - A `double` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_DOUBLE(name, opt, comment, check, update,
                    default, minimum, maximum, blocksize)
MYSQL_SYSVAR_DOUBLE(name, varname, opt, comment, check, update,
                    default, minimum, maximum, blocksize)
```

  - An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
                  default, typelib)
```

  - An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```

```

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                 default, typelib)
```

Internally, all mutable and plugin system variables are stored in a `HASH` structure.

Display of the server command-line help text is handled by compiling a `DYNAMIC_ARRAY` of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

Client Plugin Descriptors

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The `st_mysql_client_plugin` structure in the `client_plugin.h` file defines a “generic” descriptor that contains the common members:

```
struct st_mysql_client_plugin
{
  int type;
  unsigned int interface_version;
  const char *name;
  const char *author;
  const char *desc;
  unsigned int version[3];
  const char *license;
  void *mysql_api;
  int (*init)(char *, size_t, int, va_list);
  int (*deinit)();
  int (*options)(const char *option, const void *);
};
```

The common `st_mysql_client_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- `interface_version`: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- `name`: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to a MySQL client program.
- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.

- `version`: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- `license`: A string that specifies the license type.
- `mysql_api`: For internal use. Specify it as `NULL` in the plugin descriptor.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

  The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.
- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- `options`: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value. The function returns zero for success and nonzero for failure.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:

```
mysql_declare_client_plugin(plugin_type)
   ... members common to all client plugins ...
   ... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the *`plugin_type`* argument to generate their values automatically. For example, declare an authentication client plugin like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
  "my_auth_plugin",
  "Author Name",
  "My Client Authentication Plugin",
  {1,0,0},
  "GPL",
  NULL,
  my_auth_init,
  my_auth_deinit,
  my_auth_options,
  my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (`my_auth_main()` in the descriptor just shown) that handles communication with the server. See Section 28.2.4.9, “Writing Authentication Plugins”.

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 27.7.13, “C API Client Plugin Functions”.

28.2.4.3 Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using `CMake`, it should be able to generate the correct compilation commands for your system. If the library is named `somepluglib`, you should end up with a shared library file that has a name something like `somepluglib.so`. (The `.so` file name suffix might differ on your system.)

To use `CMake`, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```
MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
  MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")
```

When `CMake` generates the `Makefile`, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See Section 28.3, “MySQL Services for Components and Plugins”.

Run `CMake`, then run `make`:

```
shell> cmake .
shell> make
```

If you need to specify configuration options to `CMake`, see Section 2.8.4, “MySQL Source-Configuration Options”, for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+---------------+------------------+
| Variable_name | Value            |
+---------------+------------------+
| base          | /usr/local/mysql |
+---------------+------------------+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
```

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+---------------+---------------------------------+
| Variable_name | Value                           |
+---------------+---------------------------------+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
+---------------+---------------------------------+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

28.2.4.4 Writing Full-Text Parser Plugins

MySQL supports server-side full-text parser plugins with `MyISAM` and `InnoDB`. For introductory information about full-text parser plugins, see Full-Text Parser Plugins.

A full-text parser plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the `plugin/fulltext` directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

   ```
   #include <mysql/plugin.h>
   ```

   `plugin.h` defines the `MYSQL_FTPARSER_PLUGIN` server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

   This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

   For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

   ```
   mysql_declare_plugin(ftexample)
   {
     MYSQL_FTPARSER_PLUGIN,      /* type                            */
     &simple_parser_descriptor,  /* descriptor                      */
     "simple_parser",            /* name                            */
     "Oracle Corporation",       /* author                          */
     "Simple Full-Text Parser",  /* description                     */
     PLUGIN_LICENSE_GPL,         /* plugin license                  */
     simple_parser_plugin_init,  /* init function (when loaded)     */
     simple_parser_plugin_deinit,/* deinit function (when unloaded) */
     0x0001,                     /* version                         */
     simple_status,              /* status variables                */
     simple_system_variables,    /* system variables                */
     NULL,
     0
   ```

```
}
mysql_declare_plugin_end;
```

The `name` member (`simple_parser`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

For more information, see Server Plugin Library and Plugin Descriptors.

3. Set up the type-specific plugin descriptor.

   Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

   ```
   struct st_mysql_ftparser
   {
     int interface_version;
     int (*parse)(MYSQL_FTPARSER_PARAM *param);
     int (*init)(MYSQL_FTPARSER_PARAM *param);
     int (*deinit)(MYSQL_FTPARSER_PARAM *param);
   };
   ```

   As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions.

   The interface version number is specified using a symbol, which is in the form: `MYSQL_xxx_INTERFACE_VERSION`. For full-text parser plugins, the symbol is `MYSQL_FTPARSER_INTERFACE_VERSION`. In the source code, you will find the actual interface version number for the full-text parser plugin defined in `include/mysql/plugin_ftparser.h`. The current interface version number is `0x0101`.

   The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

   In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

   ```
   static struct st_mysql_ftparser simple_parser_descriptor=
   {
     MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
     simple_parser_parse,              /* parsing function       */
     simple_parser_init,               /* parser init function   */
     simple_parser_deinit              /* parser deinit function */
   };
   ```

   A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

   - For indexing, the server calls the parser for each column value to be indexed.
   - For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
  int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
  int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
  void *ftparser_state;
  void *mysql_ftparam;
  struct charset_info_st *cs;
  char *doc;
  int length;
  int flags;
  enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- `mysql_parse`: A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_add_word(param, ...);
  ```

- `ftparser_state`: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.
- `mysql_ftparam`: This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`: A pointer to information about the character set of the text, or 0 if no information is available.
- `doc`: A pointer to the text to be parsed.
- `length`: The length of the text to be parsed, in bytes.
- `flags`: Parser flags. This is zero if there are no special flags. The only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.
- `mode`: The parsing mode. This value will be one of the following constants:
  - `MYSQL_FTPARSER_SIMPLE_MODE`: Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.
  - `MYSQL_FTPARSER_WITH_STOPWORDS`: Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.
  - `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`: Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

Note

For `MyISAM`, the stopword list and `ft_min_word_len` and `ft_max_word_len` are checked inside the tokenizer. For `InnoDB`, the stopword list and equivalent word length variable settings (`innodb_ft_min_token_size` and `innodb_ft_max_token_size`) are checked outside of the tokenizer. As a result, `InnoDB` plugin parsers do not need to check the stopword list, `innodb_ft_min_token_size`, or `innodb_ft_max_token_size`. Instead, it is recommended that all words be returned to `InnoDB`. However, if you want to check stopwords within your plugin parser, use `MYSQL_FTPARSER_SIMPLE_MODE`, which is for full-text search index and natural language search. For `MYSQL_FTPARSER_WITH_STOPWORDS` and `MYSQL_FTPARSER_FULL_BOOLEAN_INFO` modes, it is recommended that all words be returned to `InnoDB` including stopwords, in case of phrase searches.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
  enum enum_ft_token_type type;
  int yesno;
  int weight_adjust;
  char wasign;
  char trunc;
  int position;
```

```
  /* These are parser state and must be removed. */
  char prev;
  char *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`: The token type. The following table shows the permissible types.

Table 28.3 Full-Text Parser Token Types

Token Value	Meaning
`FT_TOKEN_EOF`	End of data
`FT_TOKEN_WORD`	A regular word
`FT_TOKEN_LEFT_PAREN`	The beginning of a group or subexpression
`FT_TOKEN_RIGHT_PAREN`	The end of a group or subexpression
`FT_TOKEN_STOPWORD`	A stopword

- `yesno`: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.
- `weight_adjust`: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 12.9.2, “Boolean Full-Text Searches”, that use the `<` and `>` operators illustrate how weighting works.
- `wasign`: The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.
- `trunc`: Whether matching should be done as if the boolean-mode `*` truncation operator had been given.
- `position`: Start position of the word in the document, in bytes. Used by `InnoDB` full-text search. For existing plugins that are called in boolean mode, support must be added for the position member.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

Note

The plugin parser framework does not support:

- The `@distance` boolean operator.
- A leading plus sign (`+`) or minus sign (`-`) boolean operator followed by a space and then a word (`'+ apple'` or `'- apple'`). The leading plus or minus sign must be directly adjacent to the word, for example: `'+apple'` or `'-apple'`.

For information about boolean full-text search operators, see Section 12.9.2, “Boolean Full-Text Searches”.

4. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
  return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
  return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
                              __attribute__((unused)))
{
  return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
                                __attribute__((unused)))
{
  return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
  char *end, *start, *docend= param->doc + param->length;

  for (end= start= param->doc;; end++)
  {
    if (end == docend)
    {
      if (end > start)
        add_word(param, start, end - start);
      break;
    }
    else if (isspace(*end))
    {
      if (end > start)
        add_word(param, start, end - start);
      start= end + 1;
    }
  }
  return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
  MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, 0, ' ', 0 };

  param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
  {"static", (char *)"just a static text", SHOW_CHAR},
  {"called", (char *)&number_of_calls,     SHOW_LONG},
  {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
| Variable_name        | Value              |
+----------------------+--------------------+
| simple_parser_static | just a static text |
| simple_parser_called | 0                  |
+----------------------+--------------------+
```

6. To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the `.so` suffix might differ depending on your platform).

7. To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

8. To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

9. Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
    ->   FULLTEXT (c) WITH PARSER simple_parser
    -> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
    ->   ('utf8mb4_0900_as_cs is a case-sensitive collation'),
    ->   ('I\'d like a case of oranges'),
    ->   ('this is sensitive information'),
    ->   ('another row'),
    ->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0

mysql> SELECT c FROM t;
+-------------------------------------------------+
| c                                               |
+-------------------------------------------------+
| utf8mb4_0900_as_cs is a case-sensitive collation |
| I'd like a case of oranges                      |
| this is sensitive information                   |
| another row                                     |
| yet another row                                 |
+-------------------------------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+--------------------------+
| MATCH(c) AGAINST('case') |
+--------------------------+
|                        0 |
|          1.2968142032623 |
|                        0 |
|                        0 |
|                        0 |
+--------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----------------------------+
| MATCH(c) AGAINST('sensitive') |
+-----------------------------+
|                           0 |
|                           0 |
|               1.3253291845322 |
|                           0 |
|                           0 |
+-----------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+----------------------------------+
| MATCH(c) AGAINST('case-sensitive') |
+----------------------------------+
|                   1.3109166622162 |
|                                 0 |
|                                 0 |
|                                 0 |
|                                 0 |
+----------------------------------+
5 rows in set (0.01 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+--------------------------+
| MATCH(c) AGAINST('I\'d') |
+--------------------------+
|                        0 |
|          1.2968142032623 |
|                        0 |
|                        0 |
|                        0 |
+--------------------------+
5 rows in set (0.01 sec)
```

Neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

28.2.4.5 Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```
mysql_declare_plugin(daemon_example)
{
  MYSQL_DAEMON_PLUGIN,
  &daemon_example_plugin,
  "daemon_example",
  "Brian Aker",
  "Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
  PLUGIN_LICENSE_GPL,
  daemon_example_plugin_init, /* Plugin Init */
  daemon_example_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  NULL,                       /* status variables                */
  NULL,                       /* system variables                */
  NULL,                       /* config options                  */
  0,                          /* flags                           */
}
mysql_declare_plugin_end;
```

The `name` member (`daemon_example`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The second member of the plugin descriptor, `daemon_example_plugin`, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```
struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION  };
```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:

- `daemon_example_plugin_init()` opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.
- `daemon_example_plugin_deinit()` closes the file and performs other cleanup.

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `daemon_example` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `libdaemon_example.so` (the `.so` suffix might differ depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory. This file grows without limit, so after you have satistifed yourself that the plugin operates correctly, unload it:

```
UNINSTALL PLUGIN daemon_example;
```

28.2.4.6 Writing INFORMATION_SCHEMA Plugins

This section describes how to write a server-side `INFORMATION_SCHEMA` table plugin. For example code that implements such plugins, see the `sql/sql_show.cc` file of a MySQL source distribution. You can also look at the example plugins found in the `InnoDB` source. See the `handler/i_s.cc` and `handler/ha_innodb.cc` files within the `InnoDB` source tree (in the `storage/innobase` directory).

To write an `INFORMATION_SCHEMA` table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <sql_class.h>
#include <table.h>
```

These header files are located in the `sql` directory of MySQL source distributions. They contain C++ structures, so the source file for an `INFORMATION_SCHEMA` plugin must be compiled as C++ (not C) code.

The source file for the example plugin developed here is named `simple_i_s_table.cc`. It creates a simple `INFORMATION_SCHEMA` table named `SIMPLE_I_S_TABLE` that has two columns named `NAME` and `VALUE`. The general descriptor for a plugin library that implements the table looks like this:

```
mysql_declare_plugin(simple_i_s_library)
{
  MYSQL_INFORMATION_SCHEMA_PLUGIN,
  &simple_table_info,               /* type-specific descriptor */
  "SIMPLE_I_S_TABLE",               /* table name */
  "Author Name",                    /* author */
```

```
  "Simple INFORMATION_SCHEMA table", /* description */
  PLUGIN_LICENSE_GPL,                /* license type */
  simple_table_init,                 /* init function */
  NULL,
  0x0100,                            /* version = 1.0 */
  NULL,                              /* no status variables */
  NULL,                              /* no system variables */
  NULL,                              /* no reserved information */
  0                                  /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`SIMPLE_I_S_TABLE`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `simple_table_info` member of the general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor member can be `NULL` (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic pointer, which it should interpret as a pointer to the table structure:

```
static int table_init(void *ptr)
{
  ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;

  schema_table->fields_info= simple_table_fields;
  schema_table->fill_table= simple_fill_table;
  return 0;
}
```

The function should set these two members of the table structure:

- `fields_info`: An array of `ST_FIELD_INFO` structures that contain information about each column.
- `fill_table`: A function that populates the table.

The array pointed to by `fields_info` should contain one element per column of the `INFORMATION_SCHEMA` plus a terminating element. The following `simple_table_fields` array for the example plugin indicates that `SIMPLE_I_S_TABLE` has two columns. `NAME` is string-valued with a length of 10 and `VALUE` is integer-valued with a display width of 20. The last structure marks the end of the array.

```
static ST_FIELD_INFO simple_table_fields[]=
{
  {"NAME", 10, MYSQL_TYPE_STRING, 0, 0 0, 0},
  {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
  {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```

For more information about the column information structure, see the definition of `ST_FIELD_INFO` in the `table.h` header file. The permissible `MYSQL_TYPE_`*`xxx`* type values are those used in the C API; see Section 27.7.5, “C API Data Structures”.

The `fill_table` member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For the example plugin, the `simple_fill_table()` function looks like this:

```
static int simple_fill_table(THD *thd, TABLE_LIST *tables, Item *cond)
{
  TABLE *table= tables->table;

  table->field[0]->store("Name 1", 6, system_charset_info);
  table->field[1]->store(1);
  if (schema_table_store_record(thd, table))
    return 1;
  table->field[0]->store("Name 2", 6, system_charset_info);
  table->field[1]->store(2);
  if (schema_table_store_record(thd, table))
    return 1;
  return 0;
}
```

For each row of the `INFORMATION_SCHEMA` table, this function initializes each column, then calls `schema_table_store_record()` to install the row. The `store()` method arguments depend on the type of value to be stored. For column 0 (`NAME`, a string), `store()` takes a pointer to a string, its length, and information about the character set of the string:

```
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (`VALUE`, an integer), `store()` takes the value and a flag indicating whether it is unsigned:

```
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate `INFORMATION_SCHEMA` tables, search for instances of `schema_table_store_record()` in `sql_show.cc`.

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

To test the plugin, install it:

```
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
    -> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
+------------------+
| TABLE_NAME       |
+------------------+
| SIMPLE_I_S_TABLE |
+------------------+
```

Try to select from it:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
+--------+-------+
| NAME   | VALUE |
+--------+-------+
| Name 1 |     1 |
| Name 2 |     2 |
+--------+-------+
```

Uninstall it:

```
mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;
```

28.2.4.7 Writing Semisynchronous Replication Plugins

This section describes how to write server-side semisynchronous replication plugins, using the example plugins found in the `plugin/semisync` directory of MySQL source distributions. That directory contains the source files for master and slave plugins named `rpl_semi_sync_master` and `rpl_semi_sync_slave`. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```
mysql_declare_plugin(semi_sync_master)
{
  MYSQL_REPLICATION_PLUGIN,
  &semi_sync_master_plugin,
  "rpl_semi_sync_master",
  "He Zhenxing",
  "Semi-synchronous replication master",
  PLUGIN_LICENSE_GPL,
  semi_sync_master_plugin_init, /* Plugin Init */
  semi_sync_master_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  semi_sync_master_status_vars, /* status variables */
  semi_sync_master_system_vars, /* system variables */
  NULL,                         /* config options */
  0,                            /* flags */
}
mysql_declare_plugin_end;
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```
mysql_declare_plugin(semi_sync_slave)
{
  MYSQL_REPLICATION_PLUGIN,
  &semi_sync_slave_plugin,
  "rpl_semi_sync_slave",
  "He Zhenxing",
  "Semi-synchronous replication slave",
  PLUGIN_LICENSE_GPL,
  semi_sync_slave_plugin_init, /* Plugin Init */
  semi_sync_slave_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  semi_sync_slave_status_vars,  /* status variables */
  semi_sync_slave_system_vars,  /* system variables */
  NULL,                         /* config options */
  0,                            /* flags */
}
mysql_declare_plugin_end;
```

For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see Server Plugin Status and

System Variables. The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
struct Mysql_replication semi_sync_master_plugin= {
  MYSQL_REPLICATION_INTERFACE_VERSION
};
```

The initialization and deinitialization function declarations look like this:

```
static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);
```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the `.so` suffix might differ depending on your platform).

28.2.4.8 Writing Audit Plugins

This section describes how to write a server-side audit plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` and `audit_null_variables.h` source files in that directory implement an audit plugin named `NULL_AUDIT`.

Note

Other examples of plugins that use the audit plugin API are the query rewrite plugin (see Section 5.6.3, “The Rewriter Query Rewrite Plugin”) and the Version Tokens plugin (see Section 5.6.4, “Version Tokens”).

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, search the server source files for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for server operations such as these:

- Client connect and disconnect events
- Writing a message to the general query log (if the log is enabled)
- Writing a message to the error log
- Sending a query result to a client

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_audit.h` defines data structures specific to audit plugins.

Audit Plugin General Descriptor

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors) and a type-specific plugin descriptor. In `audit_null.c`, the general descriptor for `audit_null` looks like this:

```
mysql_declare_plugin(audit_null)
{
  MYSQL_AUDIT_PLUGIN,         /* type                            */
  &audit_null_descriptor,     /* descriptor                      */
  "NULL_AUDIT",               /* name                            */
  "Oracle Corp",              /* author                          */
  "Simple NULL Audit",        /* description                     */
  PLUGIN_LICENSE_GPL,
  audit_null_plugin_init,     /* init function (when loaded)     */
  audit_null_plugin_deinit,   /* deinit function (when unloaded) */
  0x0003,                     /* version                         */
  simple_status,              /* status variables                */
  system_variables,           /* system variables                */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

The first member, `MYSQL_AUDIT_PLUGIN`, identifies this plugin as an audit plugin.

`audit_null_descriptor` points to the type-specific plugin descriptor, described later.

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The `audit_null_plugin_init` initialization function performs plugin initialization when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup when the plugin is unloaded.

The general plugin descriptor also refers to `simple_status` and `system_variables`, structures that expose several status and system variables. When the plugin is enabled, these variables can be inspected using `SHOW` statements (`SHOW STATUS`, `SHOW VARIABLES`) or the appropriate Performance Schema tables.

The `simple_status` structure declares several status variables with names of the form `Audit_null_`*`xxx`*. `NULL_AUDIT` increments the `Audit_null_called` status variable for every notification that it receives. The other status variables are more specific and `NULL_AUDIT` increments them only for notifications of specific events.

`system_variables` is an array of system variable elements, each of which is defined using a `MYSQL_THDVAR_`*`xxx`* macro. These system variables have names of the form `null_audit_`*`xxx`*. These variables can be used to communicate with the plugin at runtime.

Audit Plugin Type-Specific Descriptor

The `audit_null_descriptor` value in the general plugin descriptor points to the type-specific plugin descriptor. For audit plugins, this descriptor has the following structure (defined in `plugin_audit.h`):

```
struct st_mysql_audit
{
  int interface_version;
  void (*release_thd)(MYSQL_THD);
  int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
  unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
```

```
};
```

The type-specific descriptor for audit plugins has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).
- `release_thd`: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.
- `event_notify`: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.
- `class_mask`: An array of `MYSQL_AUDIT_CLASS_MASK_SIZE` elements. Each element specifies a bitmask for a given event class to indicate the subclasses for which the plugin wants notification. (This is how the plugin “subscribes” to events of interest.) An element should be 0 to ignore events for the corresponding event class.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```
event_notify function:
  if memory is needed to service the thread
    allocate memory
  ... rest of notification processing ...

release_thd function:
  if memory was allocated
    release memory
  ... rest of release processing ...
```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the `NULL_AUDIT` audit plugin, the type-specific plugin descriptor looks like this:

```
static struct st_mysql_audit audit_null_descriptor=
{
  MYSQL_AUDIT_INTERFACE_VERSION,                  /* interface version    */
  NULL,                                           /* release_thd function */
  audit_null_notify,                              /* notify function      */
  { (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
    (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
    (unsigned long) MYSQL_AUDIT_PARSE_ALL,
    (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
    (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
    (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
    (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
    (unsigned long) MYSQL_AUDIT_QUERY_ALL,
```

```
    (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL }
};
```

The server calls `audit_null_notify()` to pass audit event information to the plugin. There is no `release_thd` function.

The `class_mask` member is an array that indicates which event classes the plugin subscribes to. As shown, the array contents subscribe to all subclasses of all event classes that are available. To ignore all notifications for a given event class, specify the corresponding `class_mask` element as 0.

The number of `class_mask` elements corresponds to the number of event classes, each of which is listed in the `mysql_event_class_t` enumeration defined in `plugin_audit.h`:

```
typedef enum
{
  MYSQL_AUDIT_GENERAL_CLASS          = 0,
  MYSQL_AUDIT_CONNECTION_CLASS       = 1,
  MYSQL_AUDIT_PARSE_CLASS            = 2,
  MYSQL_AUDIT_AUTHORIZATION_CLASS    = 3,
  MYSQL_AUDIT_TABLE_ACCESS_CLASS     = 4,
  MYSQL_AUDIT_GLOBAL_VARIABLE_CLASS  = 5,
  MYSQL_AUDIT_SERVER_STARTUP_CLASS   = 6,
  MYSQL_AUDIT_SERVER_SHUTDOWN_CLASS  = 7,
  MYSQL_AUDIT_COMMAND_CLASS          = 8,
  MYSQL_AUDIT_QUERY_CLASS            = 9,
  MYSQL_AUDIT_STORED_PROGRAM_CLASS   = 10,
  /* This item must be last in the list. */
  MYSQL_AUDIT_CLASS_MASK_SIZE
} mysql_event_class_t;
```

For any given event class, `plugin_audit.h` defines bitmask symbols for individual event subclasses, as well as an *`xxx`*`_ALL` symbol that is the union of the all subclass bitmasks. For example, for `MYSQL_AUDIT_CONNECTION_CLASS` (the class that covers connect and disconnect events), `plugin_audit.h` defines these symbols:

```
typedef enum
{
  /** occurs after authentication phase is completed. */
  MYSQL_AUDIT_CONNECTION_CONNECT          = 1 << 0,
  /** occurs after connection is terminated. */
  MYSQL_AUDIT_CONNECTION_DISCONNECT       = 1 << 1,
  /** occurs after COM_CHANGE_USER RPC is completed. */
  MYSQL_AUDIT_CONNECTION_CHANGE_USER      = 1 << 2,
  /** occurs before authentication. */
  MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE = 1 << 3
} mysql_event_connection_subclass_t;

#define MYSQL_AUDIT_CONNECTION_ALL (MYSQL_AUDIT_CONNECTION_CONNECT | \
                                    MYSQL_AUDIT_CONNECTION_DISCONNECT | \
                                    MYSQL_AUDIT_CONNECTION_CHANGE_USER | \
                                    MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE)
```

To subscribe to all subclasses of the connection event class (as the `NULL_AUDIT` plugin does), a plugin specifies `MYSQL_AUDIT_CONNECTION_ALL` in the corresponding `class_mask` element (`class_mask[1]` in this case). To subscribe to only some subclasses, the plugin sets the `class_mask` element to the union of the subclasses of interest. For example, to subscribe only to the connect and change-user subclasses, the plugin sets `class_mask[1]` to this value:

```
MYSQL_AUDIT_CONNECTION_CONNECT | MYSQL_AUDIT_CONNECTION_CHANGE_USER
```

Audit Plugin Notification Function

Most of the work for an audit plugin occurs in the notification function (the `event_notify` member of the type-specific plugin descriptor). The server calls this function for each auditable event. Audit plugin notification functions have this prototype:

```
int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
```

The second and third parameters of the `event_notify` function prototype represent the event class and a generic pointer to an event structure. (Events in different classes have different structures. The notification function can use the event class value to determine which event structure applies.) The function processes the event and returns a status indicating whether the server should continue processing the event or terminate it.

For `NULL_AUDIT`, the notification function is `audit_null_notify()`. This function increments a global event counter (which the plugin exposes as the value of the `Audit_null_called` status value), and then examines the event class to determine how to process the event structure:

```
static int audit_null_notify(MYSQL_THD thd __attribute__((unused)),
                             mysql_event_class_t event_class,
                             const void *event)
{
  ...

  number_of_calls++;

  if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
  {
    const struct mysql_event_general *event_general=
                                    (const struct mysql_event_general *)event;
    ...
  }
  else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
  {
    const struct mysql_event_connection *event_connection=
                                (const struct mysql_event_connection *) event;
    ...

  }
  else if (event_class == MYSQL_AUDIT_PARSE_CLASS)
  {
    const struct mysql_event_parse *event_parse =
                                      (const struct mysql_event_parse *)event;
    ...
  }
  ...
}
```

The notification function interprets the `event` argument according to the value of `event_class`. The `event` argument is a generic pointer to the event record, the structure of which differs per event class. (The `plugin_audit.h` file contains the structures that define the contents of each event class.) For each class, `audit_null_notify()` casts the event to the appropriate class-specific structure and then checks its subclass to determine which subclass counter to increment. For example, the code to handle events in the connection-event class looks like this:

```
else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
{
  const struct mysql_event_connection *event_connection=
                               (const struct mysql_event_connection *) event;

  switch (event_connection->event_subclass)
  {
  case MYSQL_AUDIT_CONNECTION_CONNECT:
    number_of_calls_connection_connect++;
    break;
  case MYSQL_AUDIT_CONNECTION_DISCONNECT:
    number_of_calls_connection_disconnect++;
    break;
  case MYSQL_AUDIT_CONNECTION_CHANGE_USER:
    number_of_calls_connection_change_user++;
    break;
  case MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE:
```

```
    number_of_calls_connection_pre_authenticate++;
      break;
  default:
    break;
  }
}
```

Note

The general event class (`MYSQL_AUDIT_GENERAL_CLASS`) is deprecated as of MySQL 5.7.9 and will be removed in a future MySQL release. To reduce plugin overhead, it is preferable to subscribe only to the more specific event classes of interest.

For some event classes, the `NULL_AUDIT` plugin performs other processing in addition to incrementing a counter. In any case, when the notification function finishes processing the event, it should return a status indicating whether the server should continue processing the event or terminate it.

Audit Plugin Error Handling

Audit plugin notification functions can report a status value for the current event two ways:

- Use the notification function return value. In this case, the function returns zero if the server should continue processing the event, or nonzero if the server should terminate the event.
- Call the `my_message()` function to set the error state before returning from the notification function. In this case, the notification function return value is ignored and the server terminates event processing with an error. The `my_message()` arguments indicate which error to report, and its message. For example:

  ```
  my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
  ```

  Some events cannot be aborted. A nonzero return value is not taken into consideration and the `my_message()` error call must follow an `is_error()` check. For example:

  ```
  if (!thd->get_stmt_da()->is_error())
  {
    my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
  }
  ```

Some events cannot be terminated:

- `MYSQL_AUDIT_CONNECTION_DISCONNECT`: The server cannot prevent a client from disconnecting.
- `MYSQL_AUDIT_COMMAND_END`: This event provides the status of a command that has finished executing, so there is no purpose to terminating it.

If an audit plugin returns nonzero status for a nonterminable event, the server ignores the status and continues processing the event. This is also true if an audit plugin uses the `my_message()` function to terminate a nonterminable event.

Audit Plugin Usage

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `NULL_AUDIT` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
+---------------------------------------+--------+
| Variable_name                         | Value  |
+---------------------------------------+--------+
| Audit_null_authorization_column       | 0      |
| Audit_null_authorization_db           | 0      |
| Audit_null_authorization_procedure    | 0      |
| Audit_null_authorization_proxy        | 0      |
| Audit_null_authorization_table        | 0      |
| Audit_null_authorization_user         | 0      |
| Audit_null_called                     | 185547 |
| Audit_null_command_end                | 20999  |
| Audit_null_command_start              | 21001  |
| Audit_null_connection_change_user     | 0      |
| Audit_null_connection_connect         | 5823   |
| Audit_null_connection_disconnect      | 5818   |
| Audit_null_connection_pre_authenticate | 5823   |
| Audit_null_general_error              | 1      |
| Audit_null_general_log                | 26559  |
| Audit_null_general_result             | 19922  |
| Audit_null_general_status             | 21000  |
| Audit_null_global_variable_get        | 0      |
| Audit_null_global_variable_set        | 0      |
| Audit_null_parse_postparse            | 14648  |
| Audit_null_parse_preparse             | 14648  |
| Audit_null_query_nested_start         | 6      |
| Audit_null_query_nested_status_end    | 6      |
| Audit_null_query_start                | 14648  |
| Audit_null_query_status_end           | 14647  |
| Audit_null_server_shutdown            | 0      |
| Audit_null_server_startup             | 1      |
| Audit_null_table_access_delete        | 104    |
| Audit_null_table_access_insert        | 2839   |
| Audit_null_table_access_read          | 97842  |
| Audit_null_table_access_update        | 278    |
+---------------------------------------+--------+
```

`Audit_null_called` counts all events, and the other variables count instances of specific event subclasses. For example, the preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called`, `Audit_null_general_result`, and `Audit_null_general_log` to be incremented each time. Notifications occur whether or not that log is enabled.

The status variables values are aggregated across all sessions. There are no counters for individual sessions.

`NULL_AUDIT` exposes several system variables that enable communication with the plugin at runtime:

```
mysql> SHOW VARIABLES LIKE 'null_audit%';
+-----------------------------------+-------+
| Variable_name                     | Value |
+-----------------------------------+-------+
| null_audit_abort_message          |       |
| null_audit_abort_value            | 1     |
| null_audit_event_order_check      |       |
```

```
| null_audit_event_order_check_exact | 1     |
| null_audit_event_order_started     | 0     |
| null_audit_event_record            |       |
| null_audit_event_record_def        |       |
+------------------------------------+-------+
```

To check the order of audit API calls, set the `null_audit_event_order_check` variable to the expected event order. For example:

```
SET null_audit_event_order_check =
      'MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE;;;'
      'MYSQL_AUDIT_GENERAL_LOG;;;'
      'MYSQL_AUDIT_CONNECTION_CONNECT;;';
```

The statement takes advantage of the SQL syntax that concatenates adjacent strings into a single string.

The format of the value is:

```
'event_name;event_data;command' [';event_name;event_data;command'] ...
```

After the event order is matched, the `null_audit_event_order_check` value is replaced with a value of `EVENT-ORDER-OK`.

Specifying a command value of `ABORT_RET` makes it possible to abort the audit API call on the specified event. The following example aborts `INSERT` statement execution when its `MYSQL_AUDIT_QUERY_STATUS_END` event occurs:

```
SET null_audit_event_order_check =
   'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
   'MYSQL_AUDIT_GENERAL_LOG;;;'
   'MYSQL_AUDIT_QUERY_START;;;'
   'MYSQL_AUDIT_QUERY_STATUS_END;;ABORT_RET';
```

After the audit plugin matches the preceding sequence, it aborts event processing and sends an error message to the client:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';1).
```

Returning a nonzero value from the audit API notification routine is the standard way to abort event execution. It is also possible to specify a custom error code by setting the `null_audit_abort_value` variable to the value that the notification routine should return:

```
SET null_audit_abort_value = 123;
```

Aborting a sequence results in a standard message with the custom error code. Suppose that you set audit log system variables like this:

```
SET null_audit_abort_value = 123;
SET null_audit_event_order_check =
    'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
    'MYSQL_AUDIT_GENERAL_LOG;;;'
    'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then execution of `SELECT 1` results in this error:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_START';123).
```

An event can be also aborted with a custom message, specified by setting the `null_audit_abort_message` variable: Suppose that you set audit log system variables like this:

```
SET null_audit_abort_message = 'Custom error text.';
SET null_audit_event_order_check =
    'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
    'MYSQL_AUDIT_GENERAL_LOG;;;'
    'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then aborting a sequence results in the following error:

```
ERROR 3164 (HY000): Custom error text.
```

For test-creation purposes, it is possible to record events that pass through the plugin. Recording starts by specifying start and end events in the `null_audit_event_record_def` variable:

```
SET null_audit_event_record_def =
    'MYSQL_AUDIT_COMMAND_START;MYSQL_AUDIT_COMMAND_END';
```

Statement execution results in storing the events that occur in the `null_audit_event_record` variable.

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN NULL_AUDIT;
```

28.2.4.9 Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see Section 6.3.10, “Pluggable Authentication”, and Section 6.3.11, “Proxy Users”.

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- `plugin.h`: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 27.7.13, “C API Client Plugin Functions”).
- `plugin_auth.h`: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.
- `plugin_auth_common.h`: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

- For a source file that implements a server authentication plugin, include this file:

```
#include <mysql/plugin_auth.h>
```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

```
#include <mysql/plugin_auth.h>
#include <mysql/client_plugin.h>
#include <mysql.h>
```

`plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

This section describes how to write a pair of simple server and client authentication plugins that work together.

Warning

These plugins accept any non-empty password and the password is sent in clear text. This is insecure, so the plugins *should not be used in production environments.*

The server-side and client-side plugins developed here both are named `auth_simple`. As described in Section 28.2.4.2, “Plugin Data Structures”, the plugin library file must have the same base name as the client plugin, so the source file name is `auth_simple.c` and produces a library named `auth_simple.so` (assuming that your system uses `.so` as the suffix for library files).

In MySQL source distributions, authentication plugin source is located in the `plugin/auth` directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see `sql/sql_acl.cc` for plugins that are built in to the MySQL server and `sql-common/client.c` for plugins that are built in to the `libmysqlclient` client library. (For the built-in client plugins, note that the `auth_plugin_t` structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

Writing the Server-Side Authentication Plugin

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see Server Plugin Library and Plugin Descriptors). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_plugin(auth_simple)
{
  MYSQL_AUTHENTICATION_PLUGIN,
  &auth_simple_handler,                /* type-specific descriptor */
  "auth_simple",                       /* plugin name */
  "Author Name",                       /* author */
  "Any-password authentication plugin", /* description */
  PLUGIN_LICENSE_GPL,                  /* license type */
  NULL,                                /* no init function */
  NULL,                                /* no deinit function */
  0x0100,                              /* version = 1.0 */
  NULL,                                /* no status variables */
  NULL,                                /* no system variables */
  NULL,                                /* no reserved information */
  0                                    /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`auth_simple`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `auth_simple_handler` member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the `st_mysql_auth` structure (defined in `plugin_auth.h`):

```
struct st_mysql_auth
{
  int interface_version;
  const char *client_auth_plugin;
  int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
  int (*generate_authentication_string)(char *outbuf,
      unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
  int (*validate_authentication_string)(char* const inbuf, unsigned int buflen);
  int (*set_salt)(const char *password, unsigned int password_len,
                  unsigned char* salt, unsigned char *salt_len);
  const unsigned long authentication_flags;
};
```

The `st_mysql_auth` structure has these members:

- `interface_version`: The type-specific API version number, always `MYSQL_AUTHENTICATION_INTERFACE_VERSION`
- `client_auth_plugin`: The client plugin name
- `authenticate_user`: A pointer to the main plugin function that communicates with the client
- `generate_authentication_string`: A pointer to a plugin function that generates a password digest from an authentication string
- `validate_authentication_string`: A pointer to a plugin function that validates a password digest
- `set_salt`: A pointer to a plugin function that converts a scrambled password to binary form
- `authentication_flags`: A flags word

The `client_auth_plugin` member should indicate the name of the client plugin if a specific plugin is required. A value of `NULL` means “any plugin.” In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For `auth_simple`, the type-specific descriptor looks like this:

```
static struct st_mysql_auth auth_simple_handler =
{
  MYSQL_AUTHENTICATION_INTERFACE_VERSION,
  "auth_simple",             /* required client-side plugin name */
  auth_simple_server         /* server-side plugin main function */
  generate_auth_string_hash, /* generate digest from password string */
  validate_auth_string_hash, /* validate password digest */
  set_salt,                  /* generate password salt value */
  AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE
};
```

The main function, `auth_simple_server()`, takes two arguments representing an I/O structure and a `MYSQL_SERVER_AUTH_INFO` structure. The structure definition, found in `plugin_auth.h`, looks like this:

```
typedef struct st_mysql_server_auth_info
{
  char *user_name;
  unsigned int user_name_length;
  const char *auth_string;
  unsigned long auth_string_length;
  char authenticated_as[MYSQL_USERNAME_LENGTH+1];
  char external_user[512];
  int  password_used;
  const char *host_or_ip;
```

```
  unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a `_length` member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.

When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- `user_name`: The user name sent by the client. The value becomes the `USER()` function value.
- `user_name_length`: The length of `user_name` in bytes.
- `auth_string`: The value of the `authentication_string` column of the `mysql.user` table row for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

  Suppose that you create an account using the following statement:

  ```
  CREATE USER 'my_user'@'localhost'
    IDENTIFIED WITH my_plugin AS 'my_auth_string';
  ```

  When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.
- `auth_string_length`: The length of `auth_string` in bytes.
- `authenticated_as`: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see Implementing Proxy User Support in Authentication Plugins). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.
- `external_user`: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly; for example, to the connecting user name. The value is represented as a string at most 511 bytes long, plus a terminating null.
- `password_used`: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.

`password_used`	`%s` Handling
0	NO
1	YES
2	There will be no `%s`

- `host_or_ip`: The name of the client host if it can be resolved, or the IP address otherwise.
- `host_or_ip_length`: The length of `host_or_ip` in bytes.

The `auth_simple` main function, `auth_simple_server()`, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```
```

```
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
                               MYSQL_SERVER_AUTH_INFO *info)
{
  unsigned char *pkt;
  int pkt_len;

  /* read the password as null-terminated string, fail on error */
  if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
    return CR_ERROR;

  /* fail on empty password */
  if (!pkt_len || *pkt == '\0')
  {
    info->password_used= PASSWORD_USED_NO;
    return CR_ERROR;
  }

  /* accept any nonempty password */
  info->password_used= PASSWORD_USED_YES;

  return CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
`CR_OK`	Success
`CR_OK_HANDSHAKE_COMPLETE`	Do not send a status packet back to client
`CR_ERROR`	Error
`CR_AUTH_USER_CREDENTIALS`	Authentication failure
`CR_AUTH_HANDSHAKE`	Authentication handshake failure
`CR_AUTH_PLUGIN_ERROR`	Internal plugin error

For an example of how the handshake works, see the `plugin/auth/dialog.c` source file.

The server counts plugin errors in the Performance Schema `host_cache` table.

`auth_simple_server()` is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the `info->authenticated_as` member to the proxied user name. For information about proxying, see Section 6.3.11, “Proxy Users”, and Implementing Proxy User Support in Authentication Plugins.

The `generate_authentication_string` member of the plugin descriptor takes the password and generates a password hash (digest) from it:

- The first two arguments are pointers to the output buffer and its maximum length in bytes. The function should write the password hash to the output buffer and reset the length to the actual hash length.
- The second two arguments indicate the password input buffer and its length in bytes.
- The function returns 0 for success, 1 if an error occurred.

For the `auth_simple` plugin, the `generate_auth_string_hash()` function implements the `generate_authentication_string` member. It just makes a copy of the password, unless it is too long to fit in the output buffer.

```
int generate_auth_string_hash(char *outbuf, unsigned int *buflen,
                              const char *inbuf, unsigned int inbuflen)
```

```
{
  /*
    fail if buffer specified by server cannot be copied to output buffer
  */
  if (*buflen < inbuflen)
    return 1;   /* error */
  strncpy(outbuf, inbuf, inbuflen);
  *buflen= strlen(inbuf);
  return 0;     /* success */
}
```

The `validate_authentication_string` member of the plugin descriptor validates a password hash:

- The arguments are a pointer to the password hash and its length in bytes.
- The function returns 0 for success, 1 if the password hash cannot be validated.

For the `auth_simple` plugin, the `validate_auth_string_hash()` function implements the `validate_authentication_string` member. It returns success unconditionally:

```
int validate_auth_string_hash(char* const inbuf  __attribute__((unused)),
                              unsigned int buflen  __attribute__((unused)))
{
  return 0;     /* success */
}
```

The `set_salt` member of the plugin descriptor is used only by the `mysql_native_password` plugin (see Section 6.5.1.1, “Native Pluggable Authentication”). For other authentication plugins, you can use this trivial implementation:

```
int set_salt(const char* password __attribute__((unused)),
             unsigned int password_len __attribute__((unused)),
             unsigned char* salt __attribute__((unused)),
             unsigned char* salt_len)
{
  *salt_len= 0;
  return 0;     /* success */
}
```

The `authentication_flags` member of the plugin descriptor contains flags that affect plugin operation. The permitted flags are:

- `AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE`: Credential changes are a privileged operation. If this flag is set, the server requires that the user has the global `CREATE USER` privilege or the `UPDATE` privilege for the `mysql` database.
- `AUTH_FLAG_USES_INTERNAL_STORAGE`: Whether the plugin uses internal storage (in the `authentication_string` column of `mysql.user` rows). If this flag is not set, attempts to set the password fail and the server produces a warning.

Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see Client Plugin Descriptors). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
  "auth_simple",                        /* plugin name */
  "Author Name",                        /* author */
  "Any-password authentication plugin", /* description */
  {1,0,0},                              /* version = 1.0.0 */
  "GPL",                                /* license type */
```

```
  NULL,                                 /* for internal use */
  NULL,                                 /* no init function */
  NULL,                                 /* no deinit function */
  NULL,                                 /* no option-handling function */
  auth_simple_client                    /* main function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. (For descriptions, see Client Plugin Descriptors.) Following the common members, the descriptor has an additional member specific to authentication plugins. This is the “main” function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
  int res;

  /* send password as null-terminated string in clear text */
  res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                         strlen(mysql->passwd) + 1);

  return res ? CR_ERROR : CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
CR_OK	Success
CR_OK_HANDSHAKE_COMPLETE	Success, client done
CR_ERROR	Error

CR_OK_HANDSHAKE_COMPLETE indicates that the client has done its part successfully and has read the last packet. A client plugin may return CR_OK_HANDSHAKE_COMPLETE if the number of round trips in the authentication protocol is not known in advance and the plugin must read another packet to determine whether authentication is finished.

Using the Authentication Plugins

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable).

Register the server-side plugin with the server. For example, to load the plugin at server startup, use a --plugin-load=auth_simple.so option (adjust the .so suffix for your platform as necessary).

Create a user for whom the server will use the auth_simple plugin for authentication:

```
mysql> CREATE USER 'x'@'localhost'
    -> IDENTIFIED WITH auth_simple;
```

Use a client program to connect to the server as user x. The server-side auth_simple plugin communicates with the client program that it should use the client-side auth_simple plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```
shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)

shell> mysql --user=x --password
```

```
Enter password: abc
mysql>
```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to indavertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see Section 5.6.1, “Installing and Uninstalling Plugins”, and Section 6.3.10, “Pluggable Authentication”.

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 27.7.13, “C API Client Plugin Functions”.

Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see Section 6.3.11, “Proxy Users”). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the `authenticated_as` member of the `MYSQL_SERVER_AUTH_INFO` structure, to indicate the proxied user name. It may also optionally set the `external_user` member, to set the value of the `external_user` system variable.
- Proxy user accounts must be set up to be authenticated by the plugin. Use the `CREATE USER` or `GRANT` statement to associate accounts with plugins.
- Proxy user accounts must have the `PROXY` privilege for the proxied accounts. Use the `GRANT` statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set `authenticated_as` to the proxied user name. The rest is optional (setting `external_user`) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication string passed to it by the server. This string comes from the `AS` part of the `IDENTIFIED WITH` clause of the `CREATE USER` statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER ''@'%.example.com'
```

```
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER ''@'%.example.org'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if `extuser2` connects from an `example.com` host, the server passes `'extuser1=mysqlusera, extuser2=mysqluserb'` to the plugin, and the plugin should copy `mysqluserb` into `authenticated_as`, with a terminating null byte. If `extuser2` connects from an `example.org` host, the server passes `'extuser1=mysqluserc, extuser2=mysqluserd'`, and the plugin should copy `mysqluserd` instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change `authenticated_as`, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named `auth_simple_proxy`. Like the `auth_simple` plugin described earlier, `auth_simple_proxy` accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the `auth_string` authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of `authenticated_as` unchanged.
- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to `authenticated_as` so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no `AS` clause, and one includes an `AS` clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
  IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
  IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';
```

In addition, create an account for the proxied user and grant `plugin_user2` the `PROXY` privilege for it:

```
CREATE USER 'proxied_user'@'localhost'
  IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY
  ON 'proxied_user'@'localhost'
  TO 'plugin_user2'@'localhost';
```

Before the server invokes an authentication plugin, it sets `authenticated_as` to the client user name. To indicate that the user is a proxy, the plugin should set `authenticated_as` to the proxied user name. For `auth_simple_proxy`, this means that it must examine the `auth_string` value, and, if the value is nonempty, copy it to the `authenticated_as` member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the `external_user` member to the client user name; this becomes the value of the `external_user` system variable.

```
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio,
                                     MYSQL_SERVER_AUTH_INFO *info)
{
```

```
  unsigned char *pkt;
  int pkt_len;

  /* read the password as null-terminated string, fail on error */
  if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
    return CR_ERROR;

  /* fail on empty password */
  if (!pkt_len || *pkt == '\0')
  {
    info->password_used= PASSWORD_USED_NO;
    return CR_ERROR;
  }

  /* accept any nonempty password */
  info->password_used= PASSWORD_USED_YES;

  /* if authentication string is nonempty, use as proxied user name */
  /* and use client name as external_user value */
  if (info->auth_string_length > 0)
  {
    strcpy (info->authenticated_as, info->auth_string);
    strcpy (info->external_user, info->user_name);
  }

  return CR_OK;
}
```

After a successful connection, the `USER()` function should indicate the connecting client user and host name, and `CURRENT_USER()` should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as `plugin_user1`:

```
shell> mysql --user=plugin_user1 --password
Enter password: x
```

In this case, there should be no proxying:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
         USER(): plugin_user1@localhost
 CURRENT_USER(): plugin_user1@localhost
   @@proxy_user: NULL
@@external_user: NULL
```

Then connect as `plugin_user2`:

```
shell> mysql --user=plugin_user2 --password
Enter password: x
```

In this case, `plugin_user2` should be proxied to `proxied_user`:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
         USER(): plugin_user2@localhost
 CURRENT_USER(): proxied_user@localhost
   @@proxy_user: 'plugin_user2'@'localhost'
@@external_user: 'plugin_user2'@'localhost'
```

28.2.4.10 Writing Password-Validation Plugins

This section describes how to write a server-side password-validation plugin. The instructions are based on the source code in the `plugin/password_validation` directory of MySQL source

distributions. The `validate_password.cc` source file in that directory implements the plugin named `validate_password`.

To write a password-validation plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_validate_password.h>
```

`plugin_validate_password.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_VALIDATE_PASSWORD_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_validate_password.h` defines data structures specific to password-validation plugins.

A password-validation plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In `validate_password.cc`, the general descriptor for `validate_password` looks like this:

```
mysql_declare_plugin(validate_password)
{
  MYSQL_VALIDATE_PASSWORD_PLUGIN,     /*   type                            */
  &validate_password_descriptor,      /*   descriptor                      */
  "validate_password",                /*   name                            */
  "Oracle Corporation",               /*   author                          */
  "check password strength",          /*   description                     */
  PLUGIN_LICENSE_GPL,
  validate_password_init,             /*   init function (when loaded)     */
  validate_password_deinit,           /*   deinit function (when unloaded) */
  0x0100,                             /*   version                         */
  NULL,
  validate_password_system_variables, /*   system variables                */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

The `name` member (`validate_password`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `validate_password_system_variables`, a structure that exposes several system variables to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var* validate_password_system_variables[]= {
  MYSQL_SYSVAR(length),
  MYSQL_SYSVAR(number_count),
  MYSQL_SYSVAR(mixed_case_count),
  MYSQL_SYSVAR(special_char_count),
  MYSQL_SYSVAR(policy),
  MYSQL_SYSVAR(dictionary_file),
  NULL
};
```

The `validate_password_init` initialization function reads the dictionary file if one was specified, and the `validate_password_deinit` function frees data structures associated with the file.

The `validate_password_descriptor` value in the general descriptor points to the type-specific descriptor. For password-validation plugins, this descriptor has the following structure:

```
struct st_mysql_validate_password
{
  int interface_version;
  /*
```

```
    This function returns TRUE for passwords which satisfy the password
    policy (as chosen by plugin variable) and FALSE for all other
    password
  */
  int (*validate_password)(mysql_string_handle password);
  /*
    This function returns the password strength (0-100) depending
    upon the policies
  */
  int (*get_password_strength)(mysql_string_handle password);
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For password-validation plugins, the value of the `interface_version` member is `MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION` (defined in `plugin_validate_password.h`).
- `validate_password`: A function that the server calls to test whether a password satisfies the current password policy. It returns 1 if the password is okay and 0 otherwise. The argument is the password, passed as a `mysql_string_handle` value. This data type is implemented by the `mysql_string` server service. For details, see the `string_service.h` and `string_service.cc` source files in the `sql` directory.
- `get_password_strength`: A function that the server calls to assess the strength of a password. It returns a value from 0 (weak) to 100 (strong). The argument is the password, passed as a `mysql_string_handle` value.

For the `validate_password` plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_validate_password validate_password_descriptor=
{
  MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION,
  validate_password,                        /* validate function          */
  get_password_strength                     /* validate strength function */
};
```

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `validate_password` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `validate_password.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN validate_password SONAME 'validate_password.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the `validate_password` plugin is installed, it exposes system variables that indicate the password-checking parameters:

```
mysql> SHOW VARIABLES LIKE 'validate_password%';
+--------------------------------------+--------+
| Variable_name                        | Value  |
```

```
+--------------------------------------+--------+
| validate_password_dictionary_file    |        |
| validate_password_length             | 8      |
| validate_password_mixed_case_count   | 1      |
| validate_password_number_count       | 1      |
| validate_password_policy             | MEDIUM |
| validate_password_special_char_count | 1      |
+--------------------------------------+--------+
```

For descriptions of these variables, see Section 6.5.3.2, “Password Validation Plugin Options and Variables”.

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN validate_password;
```

28.2.4.11 Writing Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

Using the Test Protocol Trace Plugin

MySQL includes a test protocol trace plugin that serves to illustrate the information available from such plugins, and as a guide to writing other protocol trace plugins. To see how the test plugin works, use a MySQL source distribution; binary distributions are built with the test plugin disabled.

Enable the test protocol trace plugin by configuring MySQL with the `WITH_TEST_TRACE_PLUGIN` `CMake` option enabled. This causes the test trace plugin to be built and MySQL client programs to load it, but the plugin has no effect by default. Control the plugin using these environment variables:

- `MYSQL_TEST_TRACE_DEBUG`: Set this variable to a value other than 0 to cause the test plugin to produce diagnostic output on `stderr`.
- `MYSQL_TEST_TRACE_CRASH`: Set this variable to a value other than 0 to cause the test plugin to abort the client program if it detects an invalid trace event.

Caution

Diagnostic output from the test protocol trace plugin can disclose passwords and other sensitive information.

Given a MySQL installation built from source with the test plugin enabled, you can see a trace of the communication between the `mysql` client and the MySQL server as follows:

```
shell> export MYSQL_TEST_TRACE_DEBUG=1
shqll> mysql
test_trace: Test trace plugin initialized
test_trace: Starting tracing in stage CONNECTING
test_trace: stage: CONNECTING, event: CONNECTING
test_trace: stage: CONNECTING, event: CONNECTED
test_trace: stage: WAIT_FOR_INIT_PACKET, event: READ_PACKET
test_trace: stage: WAIT_FOR_INIT_PACKET, event: PACKET_RECEIVED
test_trace: packet received: 87 bytes
  0A 35 2E 37 2E 33 2D 6D  31 33 2D 64 65 62 75 67   .5.7.3-m13-debug
  2D 6C 6F 67 00 04 00 00  00 2B 7C 4F 55 3F 79 67   -log.....+|OU?yg

test_trace: 004: stage: AUTHENTICATE, event: AUTH_PLUGIN
test_trace: 004: Using authentication plugin: mysql_native_password
test_trace: 004: stage: AUTHENTICATE, event: SEND_AUTH_RESPONSE
test_trace: 004: sending packet: 188 bytes
  85 A6 7F 00 00 00 00 01  21 00 00 00 00 00 00 00   .?......!.......
  00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00   ................
...
mysql> quit
```

```
test_trace: 008: stage: READY_FOR_COMMAND, event: SEND_COMMAND
test_trace: 008: QUIT
test_trace: 008: stage: READY_FOR_COMMAND, event: PACKET_SENT
test_trace: 008: packet sent: 0 bytes
test_trace: 008: stage: READY_FOR_COMMAND, event: DISCONNECTED
test_trace: 008: Connection  closed
test_trace: 008: Tracing connection has ended
Bye
test_trace: Test trace plugin de-initialized
```

To disable trace output, do this:

```
shell> MYSQL_TEST_TRACE_DEBUG=
```

Using Your Own Protocol Trace Plugins

Note

To use your own protocol trace plugins, you must configure MySQL with the `WITH_TEST_TRACE_PLUGIN` `CMake` option *disabled* because only one protocol trace plugin can be loaded at a time and an error occurs for attempts to load a second one. If you have already built MySQL with the test protocol trace plugin enabled to see how it works, you must rebuild MySQL without it before you can use your own plugins.

This section discusses how to write a basic protocol trace plugin named `simple_trace`. This plugin provides a framework showing how to set up the client plugin descriptor and create the trace-related callback functions. In `simple_trace`, these functions are rudimentary and do little other than illustrate the arguments required. To see in detail how a trace plugin can make use of trace event information, check the source file for the test protocol trace plugin (`test_trace_plugin.cc` in the `libmysql` directory of a MySQL source distribution). However, note that the `st_mysql_client_plugin_TRACE` structure used there differs from the structures used with the usual client plugin declaration macros. In particular, the first two members are defined explicitly, not implicitly by declaration macros.

Several header files contain information relevant to protocol trace plugins:

- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 27.7.13, “C API Client Plugin Functions”).
- `plugin_trace.h`: Contains declarations for client-side plugins of type `MYSQL_CLIENT_TRACE_PLUGIN`. It also contains descriptions of the permitted protocol stages, transitions between stages, and the types of events permitted at each stage.

To write a protocol trace plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_trace.h>
#include <mysql.h>
```

`plugin_trace.h` includes `client_plugin.h`, so you need not include the latter file explicitly.

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see Client Plugin Descriptors). For the `simple_trace` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(TRACE)
  "simple_trace",                 /* plugin name */
  "Author Name",                  /* author */
```

```
  "Simple protocol trace plugin", /* description */
  {1,0,0},                        /* version = 1.0.0 */
  "GPL",                          /* license type */
  NULL,                           /* for internal use */
  plugin_init,                    /* initialization function */
  plugin_deinit,                  /* deinitialization function */
  plugin_options,                 /* option-handling function */
  trace_start,                    /* start-trace function */
  trace_stop,                     /* stop-trace function */
  trace_event                     /* event-handling function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. The members following the common members implement trace event handling.

Function members for which the plugin needs no processing can be declared as `NULL` in the descriptor, in which case you need not write any corresponding function. For illustration purposes and to show the argument syntax, the following discussion implements all functions listed in the descriptor, even though some of them do nothing,

The initialization, deinitialization, and options functions common to all client plugins are declared as follows. For a description of the arguments and return values, see Client Plugin Descriptors.

```
static int
plugin_init(char *errbuf, size_t errbuf_len, int argc, va_list args)
{
  return 0;
}

static int
plugin_deinit()
{
  return 0;
}

static int
plugin_options(const char *option, const void *value)
{
  return 0;
}
```

The trace-specific members of the client plugin descriptor are callback functions. The following descriptions provide more detail on how they are used. Each has a first argument that is a pointer to the plugin instance in case your implementation needs to access it.

`trace_start()`: This function is called at the start of each traced connection (each connection that starts after the plugin is loaded). It is passed the connection handler and the protocol stage at which tracing starts. `trace_start()` allocates memory needed by the `trace_event()` function, if any, and returns a pointer to it. If no memory is needed, this function returns `NULL`.

```
static void*
trace_start(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            enum protocol_stage stage)
{
  struct st_trace_data *plugin_data= malloc(sizeof(struct st_trace_data));

  fprintf(stderr, "Initializing trace: stage %d\n", stage);
  if (plugin_data)
  {
    memset(plugin_data, 0, sizeof(struct st_trace_data));
    fprintf(stderr, "Trace initialized\n");
    return plugin_data;
  }
  fprintf(stderr, "Could not initialize trace\n");
  exit(1);
}
```

`trace_stop()`: This function is called when tracing of the connection ends. That usually happens when the connection is closed, but can happen earlier. For example, `trace_event()` can return a nonzero value at any time and that causes tracing of the connection to terminate. `trace_stop()` is then called even though the connection has not ended.

`trace_stop()` is passed the connection handler and a pointer to the memory allocated by `trace_start()` (`NULL` if none). If the pointer is non-`NULL`, `trace_stop()` should deallocate the memory. This function returns no value.

```
static void
trace_stop(struct st_mysql_client_plugin_TRACE *self,
           MYSQL *conn,
           void *plugin_data)
{
  fprintf(stderr, "Terminating trace\n");
  if (plugin_data)
    free(plugin_data);
}
```

`trace_event()`: This function is called for each event occurrence. It is passed a pointer to the memory allocated by `trace_start()` (`NULL` if none), the connection handler, the current protocol stage and event codes, and event data. This function returns 0 to continue tracing, nonzero if tracing should stop.

```
static int
trace_event(struct st_mysql_client_plugin_TRACE *self,
            void *plugin_data,
            MYSQL *conn,
            enum protocol_stage stage,
            enum trace_event event,
            struct st_trace_event_args args)
{
  fprintf(stderr, "Trace event received: stage %d, event %d\n", stage, event);
  if (event == TRACE_EVENT_DISCONNECTED)
    fprintf(stderr, "Connection closed\n");
  return 0;
}
```

The tracing framework shuts down tracing of the connection when the connection ends, so `trace_event()` should return nonzero only if you want to terminate tracing of the connection early. Suppose that you want to trace only connections for a certain MySQL account. After authentication, you can check the user name for the connection and stop tracing if it is not the user in whom you are interested.

For each call to `trace_event()`, the `st_trace_event_args` structure contains the event data. It has this definition:

```
struct st_trace_event_args
{
  const char           *plugin_name;
  int                   cmd;
  const unsigned char  *hdr;
  size_t                hdr_len;
  const unsigned char  *pkt;
  size_t                pkt_len;
};
```

For different event types, the `st_trace_event_args` structure contains the information described following. All lengths are in bytes. Unused members are set to `0`/`NULL`.

`AUTH_PLUGIN` event:

```
plugin_name  The name of the plugin
```

`SEND_COMMAND` event:

```
cmd          The command code
hdr          Pointer to the command packet header
hdr_len      Length of the header
pkt          Pointer to the command arguments
pkt_len      Length of the arguments
```

Other `SEND_xxx` and `xxx_RECEIVED` events:

```
pkt          Pointer to the data sent or received
pkt_len      Length of the data
```

`PACKET_SENT` event:

```
pkt_len      Number of bytes sent
```

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

After the plugin library file is compiled and installed in the plugin directory, you can test it easily by setting the `LIBMYSQL_PLUGINS` environment variable to the plugin name, which affects any client program that uses that variable. `mysql` is one such program:

```
shell> export LIBMYSQL_PLUGINS=simple_trace
shqll> mysql
Initializing trace: stage 0
Trace initialized
Trace event received: stage 0, event 1
Trace event received: stage 0, event 2
...
Welcome to the MySQL monitor.  Commands end with ; or \g.
Trace event received
Trace event received
...
mysql> SELECT 1;
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
...
Trace event received: stage 8, event 14
Trace event received: stage 8, event 15
+---+
| 1 |
+---+
| 1 |
+---+
1 row in set (0.00 sec)

mysql> quit
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
Trace event received: stage 4, event 3
Connection closed
Terminating trace
Bye
```

To stop the trace plugin from being loaded, do this:

```
shell> LIBMYSQL_PLUGINS=
```

It is also possible to write client programs that directly load the plugin. You can tell the client where the plugin directory is located by calling `mysql_options()` to set the `MYSQL_PLUGIN_DIR` option:

```
char *plugin_dir = "path_to_plugin_dir";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
```

Typically, the program will also accept a `--plugin-dir` option that enables users to override the default value.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 27.7.13, “C API Client Plugin Functions”.

28.2.4.12 Writing Keyring Plugins

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to write a server-side keyring plugin that can be used by service functions to perform key-management operations. For general keyring information, see Section 6.5.4, “The MySQL Keyring”.

The instructions here are based on the source code in the `plugin/keyring` directory of MySQL source distributions. The source files in that directory implement a plugin named `keyring_file` that uses a file local to the server host for data storage.

To write a keyring plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_keyring.h>
```

`plugin_keyring.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_KEYRING_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_keyring.h` defines data structures specific to keyring plugins.

A keyring plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In `keyring.cc`, the general descriptor for `keyring_file` looks like this:

```
mysql_declare_plugin(keyring_file)
{
  MYSQL_KEYRING_PLUGIN,     /* type                                  */
  &keyring_descriptor,      /* descriptor                            */
  "keyring_file",           /* name                                  */
  "Oracle Corporation",     /* author                                */
  "store/fetch authentication data to/from a flat file", /* description */
  PLUGIN_LICENSE_GPL,
  keyring_init,             /* init function (when loaded)           */
  keyring_deinit,           /* deinit function (when unloaded)       */
  0x0100,                   /* version                               */
  NULL,                     /* status variables                      */
  keyring_system_variables, /* system variables                      */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

The `name` member (`keyring_file`) indicates the plugin name. This is the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `keyring_system_variables`, a structure that exposes a system variable to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var *keyring_system_variables[]= {
  MYSQL_SYSVAR(data),
```

```
  NULL
};
```

The `keyring_init` initialization function creates the data file if it does not exist, then reads it and initializes the keystore. The `keyring_deinit` function frees data structures associated with the file.

The `keyring_descriptor` value in the general descriptor points to the type-specific descriptor. For keyring plugins, this descriptor has the following structure:

```
struct st_mysql_keyring
{
  int interface_version;
  bool (*mysql_key_store)(const char *key_id, const char *key_type,
                          const char* user_id, const void *key, size_t key_len);
  bool (*mysql_key_fetch)(const char *key_id, char **key_type,
                          const char *user_id, void **key, size_t *key_len);
  bool (*mysql_key_remove)(const char *key_id, const char *user_id);
  bool (*mysql_key_generate)(const char *key_id, const char *key_type,
                             const char *user_id, size_t key_len);
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For keyring plugins, the value of the `interface_version` member is `MYSQL_KEYRING_INTERFACE_VERSION` (defined in `plugin_keyring.h`).
- `mysql_key_store`: A function that obfuscates and stores a key in the keyring.
- `mysql_key_fetch`: A function that deobfuscates and retrieves a key from the keyring.
- `mysql_key_remove`: A function that removes a key from the keyring.
- `mysql_key_generate`: A function that generates a new random key and stores it in the keyring.

For the `keyring_file` plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_keyring keyring_descriptor=
{
  MYSQL_KEYRING_INTERFACE_VERSION,
  mysql_key_store,
  mysql_key_fetch,
  mysql_key_remove,
  mysql_key_generate
};
```

The `mysql_key_`*`xxx`* functions implemented by a keyring plugin are analogous to the `my_key_`*`xxx`* functions exposed by the keyring service API. For example, the `mysql_key_store` plugin function is analogous to the `my_key_store` keyring service function. For information about the arguments to keyring service functions and how they are used, see Section 28.3.2, “The Keyring Service”.

To compile and install a plugin library file, use the instructions in Section 28.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `keyring_file` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `keyring_file.so` (the `.so` suffix might differ depending on your platform).

Keyring plugins typically are loaded early during the server startup process so that they are available to built-in plugins and storage engines that might depend on them. For `keyring_file`, use these lines in the server `my.cnf` file (adjust the `.so` suffix for your platform as necessary):

```
[mysqld]
early-plugin-load=keyring_file.so
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement (see Section 5.6.2, “Obtaining Server Plugin Information”). For example:

```
mysql> SELECT PLUGIN_NAME, PLUGIN_STATUS
       FROM INFORMATION_SCHEMA.PLUGINS
       WHERE PLUGIN_NAME LIKE 'keyring%';
+--------------+---------------+
| PLUGIN_NAME  | PLUGIN_STATUS |
+--------------+---------------+
| keyring_file | ACTIVE        |
+--------------+---------------+
```

While the `keyring_file` plugin is installed, it exposes a system variable that indicates the location of the data file it uses for secure information storage:

```
mysql> SHOW VARIABLES LIKE 'keyring_file%';
+-------------------+---------------------------------+
| Variable_name     | Value                           |
+-------------------+---------------------------------+
| keyring_file_data | /usr/local/mysql/keyring/keyring |
+-------------------+---------------------------------+
```

For a description of the `keyring_file_data` variable, see Section 5.1.5, “Server System Variables”.

To disable the plugin after testing it, restart the server without an `--early-plugin-load` option that names the plugin.

28.3 MySQL Services for Components and Plugins

MySQL server plugins have access to server “plugin services.” Similarly, server components have access to “component services.” The following discussion uses the term “plugins” but also applies to components.

The plugin services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls. Services are also available to user-defined functions (UDFs).
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.
- For information about plugins for testing plugin services, see Plugins for Testing Plugin Services.

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.
- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

To determine what component services exist and what functions they provide, look in the `include/mysql/components` directory (and its `services` directory) of a MySQL source distribution.

To determine what plugin services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`, which is the "umbrella" header that includes all available service-specific header files.
- Service-specific headers have names of the form `service_xxx.h`.

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at http://dev.mysql.com/doc/dev/mysql-server/latest/; in particular, see http://dev.mysql.com/doc/dev/mysql-server/latest/PAGE_EXTENDING.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.8.7, "Generating MySQL Doxygen Documentation Content".

Available component services include the following:

- `component_sys_variable_register`, `component_sys_variable_unregister`. Services for registering and unregistering system variables. These services were added in MySQL 8.0.3.
- `log_builtins`, `log_builtins_string`. Services for log components. Other `log_xxx` services may be available, but these are in flux and should not be used.
- `mysql_service_udf_registration`, `mysql_service_udf_registration_aggregate`: Services that enable components and plugins to register and unregister scalar and aggregate user-defined-functions (UDFs). Using these services, components and plugins can manage UDFs for themselves, without the need for `CREATE FUNCTION` and `DROP FUNCTION` statements. UDFs registered using these services are listed in the Performance Schema `user_defined_functions` table; see Section 25.11.16.4, "The user_defined_functions Table".
- `mysql_string`: A set of string service APIs.
- `pfs_plugin_table`: A service for dynamic Performance Schema table manipulation.

Available plugin services include the following:

- `get_sysvar_source`: A service that enables plugins to retrieve the source of system variable settings. Introduced in MySQL 8.0.3.
- `locking_service`: A service that implements locks with three attributes: Lock namespace, lock name, and lock mode. This locking interface is available at two levels: 1) As a C language interface, callable as a plugin service from server plugins or user-defined functions; 2) At the SQL level, as a set of user-defined functions that map onto calls to the service routines. For more information, see Section 28.3.1, "The Locking Service".
- `my_plugin_log_service`: A service that enables plugins to report errors and specify error messages. The server writes the messages to its error log.
- `my_snprintf`: A string-formatting service that produces consistent results across platforms.
- `status_variable_registration`. A service for registering status variables. This service was added in MySQL 8.0.3.
- `my_thd_scheduler`: A service for plugins to select a thread scheduler.
- `mysql_keyring`: A service for keyring storage. For more information, see Section 28.3.2, "The Keyring Service".
- `mysql_password_policy`: A service for password validation and strength checking.

- `plugin_registry_service`: MySQL Server includes a component-based infrastructure for improving server extensibility; see Section 5.5, “MySQL Server Components”. However, MySQL plugins use an interface that predates the component interface. The `plugin_registry_service` enables plugins to access the component registry and its services.
- `security_context`: A service that enables plugins to examine or manipulate thread security contexts. This service provides setter and getter routines to access attributes of the server `Security_context` class, which includes attributes such as login user and host, authenticated user and host, and client IP address.
- `thd_alloc`: A memory-allocation service.
- `thd_wait`: A service for plugins to report when they are going to sleep or stall.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the `my_snprintf` service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To use a service or services from within a plugin, the plugin source file must include the `plugin.h` header file to access service-related information:

```
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function. For example, to format a string into a buffer for printing, call the `my_snprintf()` function provided by the service of the same name:

```
char buffer[BUFFER_SIZE];

my_snprintf(buffer, sizeof(buffer), format_string, argument_to_format, ...);
```

To report an error that the server will write to it error log, first choose an error level. `mysql/service_my_plugin_log.h` defines these levels:

```
enum plugin_log_level
{
  MY_ERROR_LEVEL,
  MY_WARNING_LEVEL,
  MY_INFORMATION_LEVEL
};
```

Then invoke `my_plugin_log_message()`:

```
int my_plugin_log_message(MYSQL_PLUGIN *plugin, enum plugin_log_level level,
                          const char *format, ...);
```

For example:

```
my_plugin_log_message(plugin_ptr, MY_ERROR_LEVEL, "Cannot initialize plugin");
```

Some services *for* plugins may be provided *by* plugins and thus are available only if the service-providing plugin is loaded. Any MySQL component that uses such a service should check whether the service is available.

When you build your plugin, use the `-lmysqlservices` flag at link time to link in the `libmysqlservices` library. For example, for `CMake`, put this in the top-level `CMakeLists.txt` file:

```
```

```
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
 PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

28.3.1 The Locking Service

Distributions provide a locking interface that is available at two levels:

- As a C language interface, callable as a plugin service from server plugins or user-defined functions
- At the SQL level, as a set of user-defined functions that map onto calls to the service routines

For general information about plugin services, see Section 28.3, “MySQL Services for Components and Plugins”. For general information about user-defined functions, see Section 28.4.2, “Adding a New User-Defined Function”.

The locking interface has these characteristics:

- Locks have three attributes: Lock namespace, lock name, and lock mode:
  - Locks are identified by the combination of namespace and lock name. The namespace enables different applications to use the same lock names without colliding by creating locks in separate namespaces. For example, if applications A and B use namespaces of `ns1` and `ns2`, respectively, each application can use lock names `lock1` and `lock2` without interfering with the other application.
  - A lock mode is either read or write. Read locks are shared: If a session has a read lock on a given lock identifier, other sessions can acquire a read lock on the same identifier. Write locks are exclusive: If a session has a write lock on a given lock identifier, other sessions cannot acquire a read or write lock on the same identifier.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters. A namespace or lock name specified as `NULL`, the empty string, or a string longer than 64 characters results in an `ER_LOCKING_SERVICE_WRONG_NAME` error.
- The locking interface treats namespace and lock names as binary strings, so comparisons are case sensitive.
- The locking interface provides functions to acquire locks and release locks. No special privilege is required to call these functions. Privilege checking is the responsibility of the calling application.
- Locks can be waited for if not immediately available. Lock acquisition calls take an integer timeout value that indicates how many seconds to wait to acquire locks before giving up. If the timeout is reached without successful lock acquisition, an `ER_LOCKING_SERVICE_TIMEOUT` error occurs. If the timeout is 0, there is no waiting and the call produces an error if locks cannot be acquired immediately.
- The locking interface detects deadlock between lock-acquisition calls in different sessions. In this case, the locking service chooses a caller and terminates its lock-acquisition request with an `ER_LOCKING_SERVICE_DEADLOCK` error. This error does not cause transactions to roll back. To choose a session in case of deadlock, the locking service prefers sessions that hold read locks over sessions that hold write locks.
- A session can acquire multiple locks with a single lock-acquisition call. For a given call, lock acquisition is atomic: The call succeeeds if all locks are acquired. If acquisition of any lock fails, the call acquires no locks and fails, typically with an `ER_LOCKING_SERVICE_TIMEOUT` or `ER_LOCKING_SERVICE_DEADLOCK` error.

- A session can acquire multiple locks for the same lock identifier (namespace and lock name combination). These lock instances can be read locks, write locks, or a mix of both.
- Locks acquired within a session are released explicitly by calling a release-locks function, or implicitly when the session terminates (either normally or abnormally). Locks are not released when transactions commit or roll back.
- Within a session, all locks for a given namespace when released are released together.

The interface provided by the locking service is distinct from that provided by `GET_LOCK()` and related SQL functions (see Section 12.21, “Miscellaneous Functions”). For example, `GET_LOCK()` does not implement namespaces and provides only exclusive locks, not distinct read and write locks.

28.3.1.1 The Locking Service C Interface

This section describes how to use the locking service C language interface. To use the UDF interface instead, see Section 28.3.1.2, “The Locking Service UDF Interface” For general characteristics of the locking service interface, see Section 28.3.1, “The Locking Service”. For general information about plugin services, see Section 28.3, “MySQL Services for Components and Plugins”.

Source files that use the locking service should include this header file:

```
#include <mysql/service_locking.h>
```

To acquire one or more locks, call this function:

```
int mysql_acquire_locking_service_locks(MYSQL_THD opaque_thd,
                                        const char* lock_namespace,
                                        const char**lock_names,
                                        size_t lock_num,
                                        enum enum_locking_service_lock_type lock_type,
                                        unsigned long lock_timeout);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.
- `lock_names`: An array of null-terminated strings that provides the names of the locks to acquire.
- `lock_num`: The number of names in the `lock_names` array.
- `lock_type`: The lock mode, either `LOCKING_SERVICE_READ` or `LOCKING_SERVICE_WRITE` to acquire read locks or write locks, respectively.
- `lock_timeout`: An integer number of seconds to wait to acquire the locks before giving up.

To release locks acquired for a given namespace, call this function:

```
int mysql_release_locking_service_locks(MYSQL_THD opaque_thd,
                                        const char* lock_namespace);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.

Locks acquired or waited for by the locking service can be monitored at the SQL level using the Performance Schema. For details, see Locking Service Monitoring.

28.3.1.2 The Locking Service UDF Interface

This section describes how to use the locking service user-defined function (UDF) interface. To use the C language interface instead, see Section 28.3.1.1, “The Locking Service C Interface” For general characteristics of the locking service interface, see Section 28.3.1, “The Locking Service”. For general information about user-defined functions, see Section 28.4.2, “Adding a New User-Defined Function”.

Installing or Uninstalling the UDF Locking Interface

The locking service routines described in Section 28.3.1.1, “The Locking Service C Interface” need not be installed because they are built into the server. The same is not true of the user-defined functions (UDFs) that map onto calls to the service routines: The UDFs must be installed before use. This section describes how to do that. For general information about UDF installation, see Section 28.4.2.5, “UDF Compiling and Installing”.

The locking service UDFs are implemented in a plugin library file located in the directory named by the `plugin_dir` system variable. The file base name is `locking_service`. The file name suffix differs per platform (for example, `.so` for Unix and Unix-like systems, `.dll` for Windows).

To install the locking service UDFs, use the `CREATE FUNCTION` statement (adjust the `.so` suffix for your platform as necessary):

```
CREATE FUNCTION service_get_read_locks RETURNS INT SONAME 'locking_service.so';
CREATE FUNCTION service_get_write_locks RETURNS INT SONAME 'locking_service.so';
CREATE FUNCTION service_release_locks RETURNS INT SONAME 'locking_service.so';
```

If the UDFs are used on a master replication server, install them on all slave servers as well to avoid replication problems.

Once installed, the UDFs remain installed until uninstalled. To remove them, use the `DROP FUNCTION` statement:

```
DROP FUNCTION service_get_read_locks;
DROP FUNCTION service_get_write_locks;
DROP FUNCTION service_release_locks;
```

Using the UDF Locking Interface

Before using the locking service UDFs, install them according to the instructions provided at Installing or Uninstalling the UDF Locking Interface.

To acquire one or more read locks, call this function:

```
mysql> SELECT service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10);
+-------------------------------------------------------------+
| service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10) |
+-------------------------------------------------------------+
|                                                           1 |
+-------------------------------------------------------------+
```

The first argument is the lock namespace. The final argument is an integer timeout indicating how many seconds to wait to acquire the locks before giving up. The arguments in between are the lock names.

For the example just shown, the function acquires locks with lock identifiers `(mynamespace, rlock1)` and `(mynamespace, rlock2)`.

To acquire write locks rather than read locks, call this function:

```
mysql> SELECT service_get_write_locks('mynamespace', 'wlock1', 'wlock2', 10);
+-------------------------------------------------------------+
```

```
| service_get_write_locks('mynamespace', 'wlock1', 'wlock2', 10) |
+----------------------------------------------------------------+
|                                                              1 |
+----------------------------------------------------------------+
```

In this case, the lock identifiers are `(mynamespace, wlock1)` and `(mynamespace, wlock2)`.

To release all locks for a namespace, use this function:

```
mysql> SELECT service_release_locks('mynamespace');
+--------------------------------------+
| service_release_locks('mynamespace') |
+--------------------------------------+
|                                    1 |
+--------------------------------------+
```

Each locking function returns nonzero for success. If the function fails, an error occurs. For example, the following error occurs because lock names cannot be empty:

```
mysql> SELECT service_get_read_locks('mynamespace', '', 10);
ERROR 3131 (42000): Incorrect locking service lock name ''.
```

A session can acquire multiple locks for the same lock identifier. As long as a different session does not have a write lock for an identifier, the session can acquire any number of read or write locks. Each lock request for the identifier acquires a new lock. The following statements acquire three write locks with the same identifier, then three read locks for the same identifier:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock1', 'lock1', 0);
SELECT service_get_read_locks('ns', 'lock1', 'lock1', 'lock1', 0);
```

If you examine the Performance Schema `metadata_locks` table at this point, you will find that the session holds six distinct locks with the same `(ns, lock1)` identifier. (For details, see Locking Service Monitoring.)

Because the session holds at least one write lock on `(ns, lock1)`, no other session can acquire a lock for it, either read or write. If the session held only read locks for the identifier, other sessions could acquire read locks for it, but not write locks.

Locks for a single lock-acquisition call are acquired atomically, but atomicity does not hold across calls. Thus, for a statement such as the following, where `service_get_write_locks()` is called once per row of the result set, atomicity holds for each individual call, but not for the statement as a whole:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock2', 0) FROM t1 WHERE ... ;
```

Caution

Because the locking service returns a separate lock for each successful request for a given lock identifier, it is possible for a single statement to acquire a large number of locks. For example:

```
INSERT INTO ... SELECT service_get_write_locks('ns', t1.col_name, 0) FROM t1;
```

These types of statements may have certain adverse effects. For example, if the statement fails part way through and rolls back, locks acquired up to the point of failure will still exist. If the intent is for there to be a correspondence between rows inserted and locks acquired, that intent will not be satisfied. Also, if it is important that locks are granted in a certain order, be aware that result set order may differ depending on which execution plan the optimizer chooses. For these reasons, it may be best to limit applications to a single lock-acquisition call per statement.

Locking Service Monitoring

The locking service is implemented using the MySQL Server metadata locks framework, so you monitor locking service locks acquired or waited for by examining the Performance Schema `metadata_locks` table.

First, enable the metadata lock instrument:

```
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES'
    -> WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

Then acquire some locks and check the contents of the `metadata_locks` table:

```
mysql> SELECT service_get_write_locks('mynamespace', 'lock1', 0);
+-----------------------------------------------------+
| service_get_write_locks('mynamespace', 'lock1', 0) |
+-----------------------------------------------------+
|                                                   1 |
+-----------------------------------------------------+
mysql> SELECT service_get_read_locks('mynamespace', 'lock2', 0);
+----------------------------------------------------+
| service_get_read_locks('mynamespace', 'lock2', 0) |
+----------------------------------------------------+
|                                                  1 |
+----------------------------------------------------+
mysql> SELECT OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME, LOCK_TYPE, LOCK_STATUS
    -> FROM performance_schema.metadata_locks
    -> WHERE OBJECT_TYPE = 'LOCKING SERVICE'\G
*************************** 1. row ***************************
  OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
  OBJECT_NAME: lock1
    LOCK_TYPE: EXCLUSIVE
  LOCK_STATUS: GRANTED
*************************** 2. row ***************************
  OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
  OBJECT_NAME: lock2
    LOCK_TYPE: SHARED
  LOCK_STATUS: GRANTED
```

Locking service locks have an `OBJECT_TYPE` value of `LOCKING SERVICE`. This is distinct from, for example, locks acquired with the `GET_LOCK()` function, which have an `OBJECT_TYPE` of `USER LEVEL LOCK`.

The lock namespace, name, and mode appear in the `OBJECT_SCHEMA`, `OBJECT_NAME`, and `LOCK_TYPE` columns. Read and write locks have `LOCK_TYPE` values of `SHARED` and `EXCLUSIVE`, respectively.

The `LOCK_STATUS` value is `GRANTED` for an acquired lock, `PENDING` for a lock that is being waited for. You will see `PENDING` if one session holds a write lock and another session is attempting to acquire a lock having the same identifier.

Locking Service UDF Interface Reference

The SQL interface to the locking service implements the user-defined functions described in this section. For usage examples, see Using the UDF Locking Interface.

The functions share these characteristics:

- The return value is nonzero for success. Otherwise, an error occurs.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters.

- Timeout values must be integers indicating how many seconds to wait to acquire locks before giving up with an error. If the timeout is 0, there is no waiting and the function produces an error if locks cannot be acquired immediately.

These locking service UDFs are available:

- `service_get_read_locks(namespace, lock_name[, lock_name] ..., timeout)`

  Acquires one or more read (shared) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_get_write_locks(namespace, lock_name[, lock_name] ..., timeout)`

  Acquires one or more write (exclusive) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_release_locks(namespace)`

  For the given namespace, releases all locks that were acquired within the current session using `service_get_read_locks()` and `service_get_write_locks()`.

  It is not an error for there to be no locks in the namespace.

28.3.2 The Keyring Service

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to use the keyring service functions to store, retrieve, and remove keys in the MySQL keyring keystore. An SQL interface to the keyring service functions is also available as a set of user-defined functions (UDFs); see Section 6.5.4.4, “General-Purpose Keyring Key-Management Functions”. For general keyring information, see Section 6.5.4, “The MySQL Keyring”.

The keyring service uses whatever underlying keyring plugin is enabled, if any. If no keyring plugin is enabled, keyring service calls fail.

A “record” in the keystore consists of data (the key itself) and a unique identifier through which the key is accessed. The identifier has two parts:

- `key_id`: The key ID or name. `key_id` values that begin with `mysql_` are reserved by MySQL Server.
- `user_id`: The session effective user ID. If there is no user context, this value can be `NULL`. The value need not actually be a “user”; the meaning depends on the application.

  Functions that implement the keyring UDF interface pass the value of `CURRENT_USER()` as the `user_id` value to keyring service functions.

The keyring service functions have these characteristics in common:

- Each function returns 0 for success, 1 for failure.
- The `key_id` and `user_id` arguments form a unique combination indicating which key in the keyring to use.
- The `key_type` argument provides additional information about the key, such as its encryption method or intended use.
- Keyring service functions treat key IDs, user names, types, and values as binary strings, so comparisons are case sensitive. For example, IDs of `MyKey` and `mykey` refer to different keys.

These keyring service functions are available:

- `my_key_fetch()`

Deobfuscates and retrieves a key from the keyring, along with its type. The function allocates the memory for the buffers used to store the returned key and key type. The caller should zero or obfuscate the memory when it is no longer needed, then free it.

Syntax:

```
bool my_key_fetch(const char *key_id, const char **key_type,
                  const char* user_id, void **key, size_t *key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier indicating which key to fetch.
- `key_type`: The address of a buffer pointer. The function stores into it a pointer to a null-terminated string that provides additional information about the key (stored when the key was added).
- `key`: The address of a buffer pointer. The function stores into it a pointer to the buffer containing the fetched key data.
- `key_len`: The address of a variable into which the function stores the size in bytes of the `*key` buffer.

Return values:

Returns 0 for success, 1 for failure.

- `my_key_generate()`

  Generates a new random key of a given type and length and stores it in the keyring. The key has a length of `key_len` and is associated with the identifier formed from `key_id` and `user_id`. The type and length values must be consistent with the values supported by the underlying keyring plugin. See Section 6.5.4.3, “Supported Keyring Key Types”.

  Syntax:

  ```
  bool my_key_generate(const char *key_id, const char *key_type,
                       const char *user_id, size_t key_len)
  ```

  Arguments:

  - `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be generated.
  - `key_type`: A null-terminated string that provides additional information about the key.
  - `key_len`: The size in bytes of the key to be generated.

  Return values:

  Returns 0 for success, 1 for failure.

- `my_key_remove()`

  Removes a key from the keyring.

  Syntax:

  ```
  bool my_key_remove(const char *key_id, const char* user_id)
  ```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be removed.

Return values:

Returns 0 for success, 1 for failure.

- `my_key_store()`

  Obfuscates and stores a key in the keyring.

  Syntax:

```
bool my_key_store(const char *key_id, const char *key_type,
                  const char* user_id, void *key, size_t key_len)
```

  Arguments:

  - `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be stored.
  - `key_type`: A null-terminated string that provides additional information about the key.
  - `key`: The buffer containing the key data to be stored.
  - `key_len`: The size in bytes of the `key` buffer.

  Return values:

  Returns 0 for success, 1 for failure.

28.4 Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as library files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 13.7.3.1, “CREATE FUNCTION Syntax for User-Defined Functions”.
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 23.2, “Using Stored Routines (Procedures and Functions)”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you need not do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See Section 9.2.4, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.cc` file that is provided in MySQL source distributions.

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at http://dev.mysql.com/doc/dev/mysql-server/latest/. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.8.7, “Generating MySQL Doxygen Documentation Content”.

28.4.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

28.4.2 Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.8.4, “MySQL Source-Configuration Options”, and Section 2.8.5, “Dealing with Problems Compiling MySQL”.

To be able to use UDFs, you must link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C (or C ++) functions. In the following discussion, the name “xxx” is used for an example function name. To

distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

Note

When using C++ you can encapsulate your C functions within:

```
extern "C" { ... }
```

This ensures that your C++ function names remain readable in the completed UDF.

The following list describes the C/C++ functions that you write to implement the interface for a function named `XXX()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in Section 28.4.2.6, “UDF Security Precautions”.

- `xxx()`

  The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
`STRING`	`char *`
`INTEGER`	`long long`
`REAL`	`double`

  It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()`

  The initialization function for `xxx()`. If present, it can be used for the following purposes:

  - To check the number of arguments to `XXX()`.
  - To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.
  - To specify whether the result can be `NULL`.

- `xxx_deinit()`

  The deinitialization function for `xxx()`. If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

28.4.2.1 UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 28.4.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);

void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `bool maybe_null`

  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. This value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

  A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

  The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

  ```
  initid->ptr = allocated_memory;
  ```

  In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `bool const_item`

  `xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

28.4.2.2 UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 28.4.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

- `xxx_reset()`

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

  ```
  void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                 char *is_null, char *error);
  ```

  `xxx_reset()` is not needed or used in MySQL 8.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

  `xxx_clear()` is required by MySQL 8.0.

- `xxx_add()`

  This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

  ```
  void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
  ```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See Section 28.4.2.1, “UDF Calling Sequences for Simple Functions”.

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See Section 28.4.2.4, “UDF Return Values and Error Handling”.

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See Section 28.4.2.3, “UDF Argument Processing”.

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

28.4.2.3 UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message,"XXX() requires two arguments");
    return 1;
}
```

  For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` − 1.

- `enum Item_result *arg_type`

  A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

  To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message,"XXX() requires a string and an integer");
    return 1;
}
```

  Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

  As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

  Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

  `args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants,

such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double    real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

  For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

  For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

  `args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

  By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is *`alias_name`*. The `attributes` value for each argument thus depends on whether an alias was given.

  Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

  In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
```

```
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

  The `attribute_lengths` array indicates the length of each argument name.

28.4.2.4 UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multibyte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 28.4.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

28.4.2.5 UDF Compiling and Installing

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.cc` that is included in MySQL source distributions.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.cc` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable library file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.cc
```

If you are using `gcc` with `CMake` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.cc` using `gcc` directly produces a file named `udf_example.so`. Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. Obtain a MySQL source distribution. See Section 2.1.2, “How to Get MySQL”.
2. Obtain the `CMake` build utility, if necessary, from http://www.cmake.org. (Version 2.6 or later is required).
3. In the source tree, look in the `sql` directory. There are files named `udf_example.def` `udf_example.cc` there. Copy both files from this directory to your working directory.
4. Create a `CMake makefile` (`CMakeLists.txt`) with these contents:

   ```
   PROJECT(udf_example)

   # Path for MySQL include directory
   INCLUDE_DIRECTORIES("c:/mysql/include")

   ADD_DEFINITIONS("-DHAVE_DLOPEN")
   ADD_LIBRARY(udf_example MODULE udf_example.cc udf_example.def)
   TARGET_LINK_LIBRARIES(udf_example wsock32)
   ```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared library file has been installed, notify `mysqld` about the new functions with the following statements. If library files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
    ->        RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
    ->        RETURNS REAL SONAME 'udf_example.so';
```

Once installed, a function remains installed until it is uninstalled.

To delete functions, use `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` or `DELETE` privilege for the `mysql` database to create or drop functions, respectively.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

28.4.2.6 UDF Security Precautions

MySQL takes several measures to prevent misuse of user-defined functions.

UDF library files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

To use `CREATE FUNCTION` or `DROP FUNCTION`, you must have the `INSERT` or `DELETE` privilege, respectively, for the `mysql` database. This is necessary because those statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`,

`xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared library files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

28.4.3 Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:

   - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.

   - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

   ```
   static Native_func_registry func_array[]
   ```

   You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.

4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

   ```
   double   Item_func_newname::val()
   longlong Item_func_newname::val_int()
   String  *Item_func_newname::Str(String *str)
   ```

   If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

   ```
   current_thd->lex->safe_to_cache_query=0;
   ```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function cannot return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

28.5 Debugging and Porting MySQL

This section helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See http://www.mysql.com/support/supportedplatforms/database.html. If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (http://www.mysql.com/), recommending it to other users.

Note

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at Section 2.8, “Installing MySQL from Source”.

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 28.5.1, “Debugging a MySQL Server”.

Note

Before you start debugging `mysqld`, first get the test program `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works

from a developer perspective. The generated Doxygen content is available at http://dev.mysql.com/doc/dev/mysql-server/latest/. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.8.7, “Generating MySQL Doxygen Documentation Content”.

28.5.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality). See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.

If `mysqld` does not want to start, verify that you have no `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients cannot connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you have not compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.1, “General Installation Guidance”.

28.5.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you configure it with the `-DWITH_DEBUG=1` CMake option, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` using the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See Section 1.6.2, “MySQL Mailing Lists”. If you believe that you have found a bug, please use the instructions at Section 1.7, “How to Report Bugs or Problems”.

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

28.5.1.2 Creating Trace Files

If the `mysqld` server does not start or it crashes easily, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld`.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become **very large**! To generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you cannot locate the wrong place, you can open a bug report and upload the trace file to the report, so that a MySQL developer can take a look at it. For instructions, see Section 1.7, “How to Report Bugs or Problems”.

The trace file is made with the **DBUG** package by Fred Fish. See Section 28.5.3, “The DBUG Package”.

28.5.1.3 Using WER with PDB to create a Windows crashdump

Program Database files (with suffix `pdb`) are included in the **ZIP Archive Debug Binaries & Test Suite** distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem. This is a separate download from the standard MSI or Zip file.

Note

The PDB files are available in a separate file labeled "ZIP Archive Debug Binaries & Test Suite".

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with `WinDbg` or Visual Studio to debug `mysqld`.

Note

The older *Dr. Watson* debugging tool was removed in Microsoft Vista, with `WinDbg` being a common alternative.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

To use WinDbg, either install the full Windows Driver Kit (WDK) or install the standalone version.

Important

The `.exe` and `.pbd` files must be an exact match (both version number and MySQL server edition) or WinDBG will complain while attempting to load the symbols.

1. To generate a minidump `mysqld.dmp`, enable the `core-file` option under the [mysqld] section in `my.ini`. Restart the MySQL server after making these changes.

2. Create a directory to store the generated files, such as `c:\symbols`

3. Determine the path to your `windbg.exe` executable using the Find GUI or from the command line, for example: `dir /s /b windbg.exe` -- a common default is *C:\Program Files\Debugging Tools for Windows (x64)\windbg.exe*

4. Launch `windbg.exe` giving it the paths to `mysqld.exe`, `mysqld.pdb`, `mysqld.dmp`, and the source code. Alternatively, pass in each path from the WinDbg GUI. For example:

```
windbg.exe -i "C:\mysql-8.0.4-winx64\bin\"^
 -z "C:\mysql-8.0.4-winx64\data\mysqld.dmp"^
 -srcpath "E:\ade\mysql_archives\8.0\8.0.4\mysql-8.0.4"^
 -y "C:\mysql-8.0.4-winx64\bin;SRV*c:\symbols*http://msdl.microsoft.com/download/symbols"^
 -v -n -c "!analyze -vvvvv"
```

Note

The `^` character and newline are removed by the Windows command line processor, so be sure the spaces remain intact.

28.5.1.4 Debugging mysqld under gdb

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

Use the `--gdb` option to `mysqld` to install an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` does not free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections` + 1. In most cases just using `--thread_cache_size=5'` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb>   backtrace full
gdb>   quit
```

See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download gdb 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the preceding output in a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

If `mysqld` hangs, you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

28.5.1.5 Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See Section 5.4.2, “The Error Log”. To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See Section 28.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
```

```
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

   ```
   0x9da402
   0x6648e9
   0x7f1a5af000f0
   0x7f1a5a10f0f2
   0x7412cb
   0x688354
   0x688494
   0x67a170
   0x67f0ad
   0x67fdf8
   0x6811b6
   0x66e05e
   ```

2. Make a symbol file for the `mysqld` server:

   ```
   shell> nm -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If `mysqld` is not linked statically, use the following command instead:

   ```
   shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

   ```
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
   ```

   If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See Section 1.7, “How to Report Bugs or Problems”.

Newer versions of `glibc` stack trace functions also print the address as relative to the object. On `glibc`-based systems (Linux), the trace for a crash within a plugin looks something like:

```
plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]
```

To translate the relative address (`+0x9a6`) into a file name and line number, use this command:

```
shell> addr2line -fie auth_test_plugin.so 0x9a6
auth_test_plugin
mysql-trunk/plugin/auth/test_plugin.c:65
```

The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
mysql-trunk/plugin/auth/test_plugin.c:88
```

Windows already prints the address, function name and line:

```
000007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

28.5.1.6 Using Server Logs to Find Causes of Errors in mysqld

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See Section 5.4.3, “The General Query Log”. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as *`host_name`*`.log` In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that did not complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 13.8.2, “EXPLAIN Syntax”.

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See Section 5.4.5, “The Slow Query Log”.

If you find the text `mysqld restarted` in the error log (normally a file named *`host_name`*`.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your

tables with `myisamchk` (see Chapter 5, *MySQL Server Administration*), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this does not help and you cannot find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at http://lists.mysql.com/, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.4, “Server Command Options”.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

28.5.1.7 Making a Test Case If You Experience Table Corruption

The following procedure applies to `MyISAM` tables. For information about steps to take when encountering `InnoDB` table corruption, see Section 1.7, “How to Report Bugs or Problems”.

If you encounter corrupted `MyISAM` tables or if `mysqld` always fails after some update statements, you can test whether the issue is reproducible by doing the following:

1. Stop the MySQL daemon with `mysqladmin shutdown`.
2. Make a backup of the tables to guard against the very unlikely case that the repair does something bad.
3. Check all tables with `myisamchk -s database/*.MYI`. Repair any corrupted tables with `myisamchk -r database/*table*.MYI`.
4. Make a second backup of the tables.
5. Remove (or move away) any old log files from the MySQL data directory if you need more space.
6. Start `mysqld` with the binary log enabled. If you want to find a statement that crashes `mysqld`, you should start the server with the general query log enabled as well. See Section 5.4.3, “The General Query Log”, and Section 5.4.4, “The Binary Log”.
7. When you have gotten a crashed table, stop the `mysqld` server.
8. Restore the backup.
9. Restart the `mysqld` server *without* the binary log enabled.
10. Re-execute the statements with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
11. If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found a reproducible bug. FTP the tables and the binary log to our bugs database using the instructions given in Section 1.7, “How to Report Bugs or Problems”. If you are a support customer, you can use the MySQL Customer Support Center (http://www.mysql.com/support/) to alert the MySQL team about the problem and have it fixed as soon as possible.

28.5.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `-DWITH_DEBUG=1`. See Section 2.8.4, “MySQL Source-Configuration Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.7, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

28.5.3 The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is doing. See Section 28.5.1.2, “Creating Trace Files”.

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It's best to use a recent distribution to get the most updated DBUG manual.

The DBUG package can be used by invoking a program with the `--debug[=debug_options]` or `-#[debug_options]` option. If you specify the `--debug` or `-#` option without a *`debug_options`* value, most MySQL programs use a default value. The server default is `d:t:i:o,/tmp/mysqld.trace` on Unix and `d:t:i:O,\mysqld.trace` on Windows. The effect of this default is:

- `d`: Enable output for all debug macros
- `t`: Trace function calls and exits
- `i`: Add PID to output lines
- `o,/tmp/mysqld.trace`, `O,\mysqld.trace`: Set the debug output file.

Most client programs use a default *`debug_options`* value of `d:t:o,/tmp/`*`program_name`*`.trace`, regardless of platform.

Here are some example debug control strings as they might be specified on a shell command line:

```
--debug=d:t
--debug=d:f,main,subr1:F:L:t,20
--debug=d,input,output,files:n
--debug=d:t:i:O,\\mysqld.trace
```

For `mysqld`, it is also possible to change DBUG settings at runtime by setting the `debug` system variable. This variable has global and session values:

```
mysql> SET GLOBAL debug = 'debug_options';
mysql> SET SESSION debug = 'debug_options';
```

Changes at runtime require the SYSTEM_VARIABLES_ADMIN or SUPER privilege, even for the session value.

The *debug_options* value is a sequence of colon-separated fields:

```
field_1:field_2:...:field_N
```

Each field within the value consists of a mandatory flag character, optionally preceded by a + or - character, and optionally followed by a comma-delimited list of modifiers:

```
[+|-]flag[,modifier,modifier,...,modifier]
```

The following table describes the permitted flag characters. Unrecognized flag characters are silently ignored.

Flag	Description
d	Enable output from DBUG_*XXX* macros for the current state. May be followed by a list of keywords, which enables output only for the DBUG macros with that keyword. An empty list of keywords enables output for all macros. In MySQL, common debug macro keywords to enable are enter, exit, error, warning, info, and loop.
D	Delay after each debugger output line. The argument is the delay, in tenths of seconds, subject to machine capabilities. For example, D,20 specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. An empty list enables all functions. The appropriate d or t flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.
i	Identify the process with the PID or thread ID for each line of debug or trace output.
L	Identify the source file line number for each line of debug or trace output.
n	Print the current function nesting depth for each line of debug or trace output.
N	Number each line of debug output.
o	Redirect the debugger output stream to the specified file. The default output is stderr.
O	Like o, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
p	Limit debugger actions to specified processes. A process must be identified with the DBUG_PROCESS macro and match one in the list for debugger actions to occur.
P	Print the current process name for each line of debug or trace output.
r	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
S	Do function _sanity(_file_,_line_) at each debugged function until _sanity() returns something that differs from 0.
t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

The leading + or - character and trailing list of modifiers are used for flag characters such as d or f that can enable a debug operation for all applicable modifiers or just some of them:

- With no leading + or -, the flag value is set to exactly the modifier list as given.

- With a leading + or -, the modifiers in the list are added to or subtracted from the current modifier list.

The following examples show how this works for the d flag. An empty d list enabled output for all debug macros. A nonempty list enables output only for the macro keywords in the list.

These statements set the d value to the modifier list as given:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
+---------+
mysql> SET debug = 'd,error,warning';
mysql> SELECT @@debug;
+-----------------+
| @@debug         |
+-----------------+
| d,error,warning |
+-----------------+
```

A leading + or - adds to or subtracts from the current d value:

```
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+----------------------+
| @@debug              |
+----------------------+
| d,error,warning,loop |
+----------------------+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----------+
| @@debug   |
+-----------+
| d,warning |
+-----------+
```

Adding to “all macros enabled” results in no change:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
+---------+
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
+---------+
```

Disabling all enabled macros disables the d flag entirely:

```
mysql> SET debug = 'd,error,loop';
mysql> SELECT @@debug;
+--------------+
| @@debug      |
+--------------+
| d,error,loop |
+--------------+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
```

```
+---------+
| @@debug |
+---------+
|         |
+---------+
```

Chapter 29 MySQL Enterprise Edition

Table of Contents

29.1 MySQL Enterprise Monitor Overview 3469
29.2 MySQL Enterprise Backup Overview 3470
29.3 MySQL Enterprise Security Overview 3470
29.4 MySQL Enterprise Encryption Overview 3471
29.5 MySQL Enterprise Audit Overview 3471
29.6 MySQL Enterprise Firewall Overview 3471
29.7 MySQL Enterprise Thread Pool Overview 3472

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see http://www.mysql.com/products/.

- MySQL Enterprise Monitor
- MySQL Enterprise Backup
- MySQL Enterprise Security
- MySQL Enterprise Encryption
- MySQL Enterprise Audit
- MySQL Enterprise Firewall
- MySQL Enterprise Thread Pool

29.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy web site.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at http://dev.mysql.com/doc/mysql-monitor/en/.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Monitor Agent for each monitored host.
- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Monitor Agent*. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisors*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

29.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at http://dev.mysql.com/doc/mysql-enterprise-backup/en/.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database “grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, web site, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

29.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement authentication using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see PAM Pluggable Authentication.
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see Windows Pluggable Authentication.
- MySQL Enterprise Edition includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see Section 6.5.4, “The MySQL Keyring”.

For other related Enterprise security features, see Section 29.4, “MySQL Enterprise Encryption Overview”.

29.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see MySQL Enterprise Encryption Functions.

For other related Enterprise security features, see Section 29.3, “MySQL Enterprise Security Overview”.

29.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see MySQL Enterprise Audit.

29.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see MySQL Enterprise Firewall.

29.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see MySQL Enterprise Thread Pool.

Chapter 30 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.1 and above.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at http://dev.mysql.com/doc/workbench/en/.

MySQL Workbench provides five main areas of functionality:

- **SQL Development**: Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling**: Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration**: Enables you to create and administer server instances.
- **Data Migration**: Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support**: Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

Appendix A MySQL 8.0 Frequently Asked Questions

Table of Contents

A.1 MySQL 8.0 FAQ: General 3475
A.2 MySQL 8.0 FAQ: Storage Engines 3477
A.3 MySQL 8.0 FAQ: Server SQL Mode 3477
A.4 MySQL 8.0 FAQ: Stored Procedures and Functions 3478
A.5 MySQL 8.0 FAQ: Triggers 3482
A.6 MySQL 8.0 FAQ: Views 3484
A.7 MySQL 8.0 FAQ: INFORMATION_SCHEMA 3485
A.8 MySQL 8.0 FAQ: Migration 3485
A.9 MySQL 8.0 FAQ: Security 3486
A.10 MySQL 8.0 FAQ: MySQL Cluster 3487
A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets 3488
A.12 MySQL 8.0 FAQ: Connectors & APIs 3498
A.13 MySQL 8.0 FAQ: Replication 3498
A.14 MySQL 8.0 FAQ: InnoDB Change Buffer 3502
A.15 MySQL 8.0 FAQ: InnoDB Tablespace Encryption 3504
A.16 MySQL 8.0 FAQ: Virtualization Support 3506

A.1 MySQL 8.0 FAQ: General

A.1.1 Which version of MySQL is production-ready (GA)? 3475
A.1.2 What is the state of development (non-GA) versions? 3475
A.1.3 Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0? 3476
A.1.4 Can MySQL 8.0 do subqueries? 3476
A.1.5 Can MySQL 8.0 perform multiple-table inserts, updates, and deletes? 3476
A.1.6 Does MySQL 8.0 have a Query Cache? Does it work on Server, Instance or Database? 3476
A.1.7 Does MySQL 8.0 have Sequences? 3476
A.1.8 Does MySQL 8.0 have a `NOW()` function with fractions of seconds? 3476
A.1.9 Does MySQL 8.0 work with multi-core processors? 3476
A.1.10 Why do I see multiple processes for `mysqld`? 3476
A.1.11 Can MySQL 8.0 perform ACID transactions? 3476

A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 5.7 and MySQL 5.6 are supported for production use.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

A.1.2. What is the state of development (non-GA) versions?

MySQL follows a milestone release model that introduces pre-production-quality features and stabilizes them to release quality (see http://dev.mysql.com/doc/mysql-development-cycle/en/index.html). This process then repeats, so releases cycle between pre-production and release quality status. Please check the change logs to identify the status of a given release.

MySQL 8.0, a successor to MySQL 5.7, is being actively developed using the milestone release methodology described above.

A.1.3. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

A.1.4. Can MySQL 8.0 do subqueries?

Yes. See Section 13.2.11, “Subquery Syntax”.

A.1.5. Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 13.2.12, “UPDATE Syntax”; for that required to perform multiple-table deletes, see Section 13.2.2, “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See Section 23.3, “Using Triggers”.

A.1.6. Does MySQL 8.0 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See The MySQL Query Cache.

A.1.7. Does MySQL 8.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 8.0 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

A.1.8. Does MySQL 8.0 have a `NOW()` function with fractions of seconds?

Yes, see Section 11.3.6, “Fractional Seconds in Time Values”.

A.1.9. Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

A.1.10 Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

A.1.11 Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The NDB storage engine supports the READ COMMITTED transaction isolation level only.

A.2 MySQL 8.0 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? 3477
A.2.2 Are there any new storage engines in MySQL 8.0? 3477
A.2.3 Have any storage engines been removed in MySQL 8.0? 3477
A.2.4 Can I prevent the use of a particular storage engine? 3477
A.2.5 Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines? 3477
A.2.6 What are the unique benefits of the ARCHIVE storage engine? 3477

A.2.1. Where can I obtain complete documentation for MySQL storage engines?

See Chapter 16, *Alternative Storage Engines*. That chapter contains information about all MySQL storage engines except for the InnoDB storage engine and the NDB storage engine (used for MySQL Cluster). InnoDB is covered in Chapter 15, *The InnoDB Storage Engine*. NDB is covered in MySQL NDB Cluster 7.5 and NDB Cluster 7.6.

A.2.2. Are there any new storage engines in MySQL 8.0?

No. InnoDB is the default storage engine for new tables. See Section 15.1, “Introduction to InnoDB” for details.

A.2.3. Have any storage engines been removed in MySQL 8.0?

The PARTITION storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using -DWITH_PARTITION_STORAGE_ENGINE. partition is also no longer displayed in the output of SHOW PLUGINS, or shown in the INFORMATION_SCHEMA.PLUGINS table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own (“native”) partitioning handler. InnoDB is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The NDB storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

A.2.4. Can I prevent the use of a particular storage engine?

Yes. The disabled_storage_engines configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, disabled_storage_engines is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

A.2.5. Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines?

Yes. Using InnoDB tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See Section 29.2, “MySQL Enterprise Backup Overview”.

A.2.6. What are the unique benefits of the ARCHIVE storage engine?

The ARCHIVE storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See Section 16.5, “The ARCHIVE Storage Engine”, for details.

A.3 MySQL 8.0 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? 3478

A.3.2 How many server SQL modes are there? 3478
A.3.3 How do you determine the server SQL mode? 3478
A.3.4 Is the mode dependent on the database or connection? 3478
A.3.5 Can the rules for strict mode be extended? 3478
A.3.6 Does strict mode impact performance? 3478
A.3.7 What is the default server SQL mode when MySQL 8.0 is installed? 3478

A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.8, “Server SQL Modes”.

A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.8, “Server SQL Modes”, for a complete list of available modes.

A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

A.3.5. Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See Section 5.1.8, “Server SQL Modes”, for more information.

A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, `NO_AUTO_CREATE_USER`, and `NO_ENGINE_SUBSTITUTION`.

A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.1 Does MySQL 8.0 support stored procedures and functions? 3479
A.4.2 Where can I find documentation for MySQL stored procedures and stored functions? 3479
A.4.3 Is there a discussion forum for MySQL stored procedures? 3479
A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures? 3479
A.4.5 How do you manage stored routines? 3479
A.4.6 Is there a way to view all stored procedures and stored functions in a given database? 3479
A.4.7 Where are stored procedures stored? 3480

A.4.8 Is it possible to group stored procedures or stored functions into packages? 3480
A.4.9 Can a stored procedure call another stored procedure? 3480
A.4.10 Can a stored procedure call a trigger? 3480
A.4.11 Can a stored procedure access tables? 3480
A.4.12 Do stored procedures have a statement for raising application errors? 3480
A.4.13 Do stored procedures provide exception handling? 3480
A.4.14 Can MySQL 8.0 stored routines return result sets? 3480
A.4.15 Is `WITH RECOMPILE` supported for stored procedures? 3480
A.4.16 Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database? 3480
A.4.17 Can I pass an array as input to a stored procedure? 3480
A.4.18 Can I pass a cursor as an `IN` parameter to a stored procedure? 3480
A.4.19 Can I return a cursor as an `OUT` parameter from a stored procedure? 3481
A.4.20 Can I print out a variable's value within a stored routine for debugging purposes? 3481
A.4.21 Can I commit or roll back transactions inside a stored procedure? 3481
A.4.22 Do MySQL 8.0 stored procedures and functions work with replication? 3481
A.4.23 Are stored procedures and functions created on a master server replicated to a slave? 3481
A.4.24 How are actions that take place inside stored procedures and functions replicated? 3481
A.4.25 Are there special security requirements for using stored procedures and functions together with replication? 3481
A.4.26 What limitations exist for replicating stored procedure and function actions? 3481
A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery? 3482
A.4.28 What is being done to correct the aforementioned limitations? 3482

A.4.1. Does MySQL 8.0 support stored procedures and functions?

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?

See Section 23.2, “Using Stored Routines (Procedures and Functions)”.

A.4.3. Is there a discussion forum for MySQL stored procedures?

Yes. See http://forums.mysql.com/list.php?98.

A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

A.4.5. How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see Section 24.18, “The INFORMATION_SCHEMA ROUTINES Table”).

A.4.6. Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *`dbname`*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
    FROM INFORMATION_SCHEMA.ROUTINES
    WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see Section 24.18, “The INFORMATION_SCHEMA ROUTINES Table”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See Section 13.7.5.9, "SHOW CREATE PROCEDURE Syntax", for more information.

A.4.7. Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA ROUTINES` and `PARAMETERS` tables. See Section 24.18, "The INFORMATION_SCHEMA ROUTINES Table", and Section 24.12, "The INFORMATION_SCHEMA PARAMETERS Table".

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 13.7.5.9, "SHOW CREATE PROCEDURE Syntax".

A.4.8. Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 8.0.

A.4.9. Can a stored procedure call another stored procedure?

Yes.

A.4.10 Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

A.4.11 Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

A.4.12 Do stored procedures have a statement for raising application errors?

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 13.6.7, "Condition Handling".

A.4.13 Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 13.6.7.2, "DECLARE ... HANDLER Syntax", for details.

A.4.14 Can MySQL 8.0 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.15 Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 8.0.

A.4.16 Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

A.4.17 Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

A.4.18 Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

A.4.19 Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See Section 13.2.10, “SELECT Syntax”.

A.4.20 Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.21 Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

A.4.22 Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 23.7, “Binary Logging of Stored Programs”.

A.4.23 Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

A.4.24 How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

A.4.25 Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

A.4.26 What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

A.4.28 What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 18.2.1, “Replication Formats”.

A.5 MySQL 8.0 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.0 triggers? 3482
A.5.2 Is there a discussion forum for MySQL Triggers? 3482
A.5.3 Does MySQL 8.0 have statement-level or row-level triggers? 3482
A.5.4 Are there any default triggers? 3482
A.5.5 How are triggers managed in MySQL? 3483
A.5.6 Is there a way to view all triggers in a given database? 3483
A.5.7 Where are triggers stored? 3483
A.5.8 Can a trigger call a stored procedure? 3483
A.5.9 Can triggers access tables? 3483
A.5.10 Can a table have multiple triggers with the same trigger event and action time? 3483
A.5.11 Can triggers call an external application through a UDF? 3483
A.5.12 Is it possible for a trigger to update tables on a remote server? 3483
A.5.13 Do triggers work with replication? 3483
A.5.14 How are actions carried out through triggers on a master replicated to a slave? 3484

A.5.1. Where can I find the documentation for MySQL 8.0 triggers?

See Section 23.3, “Using Triggers”.

A.5.2. Is there a discussion forum for MySQL Triggers?

Yes. It is available at http://forums.mysql.com/list.php?99.

A.5.3. Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 8.0 does not support triggers using `FOR EACH STATEMENT`.

A.5.4. Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

A.5.5. How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See Section 13.1.18, “CREATE TRIGGER Syntax”, and Section 13.1.28, “DROP TRIGGER Syntax”, for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See Section 24.28, “The INFORMATION_SCHEMA TRIGGERS Table”.

A.5.6. Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
    FROM INFORMATION_SCHEMA.TRIGGERS
    WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 24.28, “The INFORMATION_SCHEMA TRIGGERS Table”.

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See Section 13.7.5.38, “SHOW TRIGGERS Syntax”.

A.5.7. Where are triggers stored?

Triggers are stored in the `mysql.triggers` system table, which is part of the data dictionary.

A.5.8. Can a trigger call a stored procedure?

Yes.

A.5.9. Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

A.5.10. Can a table have multiple triggers with the same trigger event and action time?

In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

A.5.11. Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

A.5.12. Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 16.8, “The FEDERATED Storage Engine”).

A.5.13. Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 18.4.1.35, “Replication and Triggers”.

A.5.14 How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 18.4.1.35, “Replication and Triggers”.

A.6 MySQL 8.0 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views? 3484
A.6.2 Is there a discussion forum for MySQL Views? 3484
A.6.3 What happens to a view if an underlying table is dropped or renamed? 3485
A.6.4 Does MySQL 8.0 have table snapshots? 3485
A.6.5 Does MySQL 8.0 have materialized views? 3485
A.6.6 Can you insert into views that are based on joins? 3485

A.6.1. Where can I find documentation covering MySQL Views?

See Section 23.5, “Using Views”.

A.6.2. Is there a discussion forum for MySQL Views?

Yes. See http://forums.mysql.com/list.php?100

A.6.3. What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See Section 13.7.2.2, “CHECK TABLE Syntax”.)

A.6.4. Does MySQL 8.0 have table snapshots?

No.

A.6.5. Does MySQL 8.0 have materialized views?

No.

A.6.6. Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7 MySQL 8.0 FAQ: INFORMATION_SCHEMA

A.7.1 Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database? 3485
A.7.2 Is there a discussion forum for `INFORMATION_SCHEMA`? 3485
A.7.3 Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`? 3485
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL `INFORMATION_SCHEMA`? 3485
A.7.5 Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database? 3485

A.7.1. Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See Chapter 24, *INFORMATION_SCHEMA Tables*

A.7.2. Is there a discussion forum for `INFORMATION_SCHEMA`?

See http://forums.mysql.com/list.php?101.

A.7.3. Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

A.7.4. What is the difference between the Oracle Data Dictionary and MySQL `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

A.7.5. Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data*.

A.8 MySQL 8.0 FAQ: Migration

A.8.1 Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0? 3486

A.8.2 How has storage engine (table type) support changed in MySQL 8.0 from previous versions? 3486

A.8.1. Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see Section 2.10.1, “Upgrading MySQL”. Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table *`tblname`* from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.
- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

A.9 MySQL 8.0 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL? 3486
A.9.2 Does MySQL 8.0 have native support for SSL? 3487
A.9.3 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it? 3487
A.9.4 Does MySQL 8.0 have built-in authentication against LDAP directories? 3487
A.9.5 Does MySQL 8.0 include support for Roles Based Access Control (RBAC)? 3487

A.9.1. Where can I find documentation that addresses security issues for MySQL?

The best place to start is Chapter 6, *Security*.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 6.1.1, “Security Guidelines”.
- Section 6.1.3, “Making MySQL Secure Against Attackers”.
- Section B.5.3.2, “How to Reset the Root Password”.
- Section 6.1.5, “How to Run MySQL as a Normal User”.
- Section 28.4.2.6, “UDF Security Precautions”.
- Section 6.1.4, “Security-Related mysqld Options and Variables”.
- Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.
- Section 2.9, “Postinstallation Setup and Testing”.
- Section 6.4, “Using Encrypted Connections”.

A.9.2. Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See Section 6.4, “Using Encrypted Connections”.

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see Section 6.4.7, “Connecting to MySQL Remotely from Windows with SSH”.

A.9.3. Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See Section 6.4, “Using Encrypted Connections”.

A.9.4. Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a PAM Authentication Plugin that supports authentication against an LDAP directory.

A.9.5. Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

A.10 MySQL 8.0 FAQ: MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the NDB storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source? 3487
A.10.2 What do “NDB” and “NDBCLUSTER” mean? 3487
A.10.3 How many computers do I need to run an NDB Cluster, and why? 3487

A.10.1. Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in MySQL Server 8.0 releases; it is released as a separate product. You are strongly advised to use NDB Cluster 7.5 for any new deployments; if you are using an older version of NDB Cluster, we recommend that you upgrade to this version soon as possible. For an overview of improvements made in NDB Cluster 7.5, see What is New in NDB Cluster 7.5.

NDB Cluster 7.6, based on MySQL Server 5.7 and version 7.6 of the NDB storage engine, is also now available as a Developer Preview release for evaluation and testing purposes. For information about new features and other important changes in this series, see What is New in NDB Cluster 7.6.

For detailed information about deploying and using NDB Cluster, see MySQL NDB Cluster 7.5 and NDB Cluster 7.6.

A.10.2. What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**ata**b**ase”. NDB and NDBCLUSTER are both names for the storage engine that enables clustering support with MySQL. NDB is preferred, but either name is correct.

A.10.3. How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

A.11.1 What CJK character sets are available in MySQL? 3488
A.11.2 I have inserted CJK characters into my table. Why does SELECT display them as "?" characters? 3489
A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? .. 3491
A.11.4 Why do Japanese character set conversions fail? 3491
A.11.5 What should I do if I want to convert SJIS 81CA to cp932? 3492
A.11.6 How does MySQL represent the Yen (¥) sign? 3492
A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? 3492
A.11.8 Why do I get Incorrect string value error messages? 3493
A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API? 3493
A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets? 3494
A.11.11 Why do some LIKE and FULLTEXT searches with CJK characters fail? 3495
A.11.12 How do I know whether character X is available in all character sets? 3496
A.11.13 Why do CJK strings sort incorrectly in Unicode? (I) 3497
A.11.14 Why do CJK strings sort incorrectly in Unicode? (II) 3497
A.11.15 Why are my supplementary characters rejected by MySQL? 3497
A.11.16 Should "CJK" be "CJKV"? 3497
A.11.17 Does MySQL permit CJK characters to be used in database and table names? 3498
A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean? 3498
A.11.19 Where can I get help with CJK and related issues in MySQL? 3498

A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the gb18030 character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the DESCRIPTION column for every entry in the INFORMATION_SCHEMA.CHARACTER_SETS table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
       FROM INFORMATION_SCHEMA.CHARACTER_SETS
       WHERE DESCRIPTION LIKE '%Chin%'
       OR DESCRIPTION LIKE '%Japanese%'
       OR DESCRIPTION LIKE '%Korean%'
       ORDER BY CHARACTER_SET_NAME;
+--------------------+---------------------------------+
| CHARACTER_SET_NAME | DESCRIPTION                     |
+--------------------+---------------------------------+
| big5               | Big5 Traditional Chinese        |
| cp932              | SJIS for Windows Japanese       |
| eucjpms            | UJIS for Windows Japanese       |
| euckr              | EUC-KR Korean                   |
| gb18030            | China National Standard GB18030 |
| gb2312             | GB2312 Simplified Chinese       |
| gbk                | GBK Simplified Chinese          |
| sjis               | Shift-JIS Japanese              |
```

```
| ujis               | EUC-JP Japanese                  |
+--------------------+----------------------------------+
```

(For more information, see Section 24.1, “The INFORMATION_SCHEMA CHARACTER_SETS Table”.)

MySQL supports three variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312`, `gbk`, and (as of MySQL 5.7.4) `gb18030`.

Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs:

- The MySQL `gbk` character set is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`.
- For a listing of `gbk`/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The `utf8` and `ucs2` character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between `U+0000` and `U+FFFF`.
- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the `utf8mb4` default collation is `utf8mb4_general_ci`, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, `gb18030_unicode_520_ci` (which requires use of the non-Unicode `gb18030` character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see Section 10.1.10.1, “Unicode Character Sets”.

A.11.2. I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using*.

  Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set*.

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
    FROM information_schema.columns
    WHERE table_schema = your_database_name
        AND table_name = your_table_name
        AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly*.

  You can obtain this information for a column `column_name` in the table `table_name` using the following query:

  ```
  SELECT HEX(column_name)
  FROM table_name;
  ```

  `3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip is possible. When you select `literal` (or `_introducer hexadecimal-value`), do you obtain `literal` as a result*?

  For example, the Japanese Katakana character *Pe* (`ペ`) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

  ```
  SELECT 'ペ' AS `ペ`;         /* or SELECT _ucs2 0x30da; */
  ```

  If the result is not also ペ, the round trip failed.

  For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL*.

  Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

  To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

  ```
  mysql> SHOW VARIABLES LIKE 'char%';
  +--------------------------+----------------------------------------+
  | Variable_name            | Value                                  |
  +--------------------------+----------------------------------------+
  | character_set_client     | utf8                                   |
  | character_set_connection | utf8                                   |
  | character_set_database   | latin1                                 |
  | character_set_filesystem | binary                                 |
  | character_set_results    | utf8                                   |
  | character_set_server     | latin1                                 |
  | character_set_system     | utf8                                   |
  | character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
  +--------------------------+----------------------------------------+
  ```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES`. statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

A.11.3. What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

A.11.4. Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F

Character Name	ucs2	sjis	cp932	ujis	eucjpms
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”. This is what is always used when the conversion cannot be performed.)

A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`.

A.11.6 How does MySQL represent the Yen (`¥`) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\`, also known as a backslash), whereas others treat it as a yen sign (`¥`).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, *`5C` is always the reverse solidus (`\`)*.

A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN` (`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
```

```
          CONVERT('₩' USING euckr) AS euckr,
          HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
+-------+----------+
| ?     | 3F       |
+-------+----------+
```

A.11.8. Why do I get `Incorrect string value` error messages?

To see the problem, create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
       (ucs2 CHAR(3) CHARACTER SET ucs2,
       gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character 汃 in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('A汃B','A汃B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
*************************** 1. row ***************************
  Level: Warning
   Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
+-------+--------------+--------+-------------+
| A汃B | 00416C4C0042 | A?B    | 413F42      |
+-------+--------------+--------+-------------+
```

Several things need explanation here:

1. The 汃 character is not in the `gb2312` character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the `Incorrect string value` message occurs as an error rather than a warning, and the `INSERT` fails.

A.11.9. Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check Configuring Connector/ODBC. If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `;` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
               & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/Net, you must specify the character set in the connection string. See Connecting to MySQL Using Connector/Net, for more information.

If you are using PHP, try this:

```
<?php
  $link = new mysqli($host, $usr, $pwd, $db);

  if( mysqli_connect_errno() )
  {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
  }

  $link->query("SET NAMES 'utf8'");
?>
```

In this case, we used `SET NAMES` to change `character_set_client`, `character_set_connection`, and `character_set_results`.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.

If you are using Connector/J, see Using Character Sets and Unicode.

A.11.10 ve upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in Section 10.1.4, “Connection Character Sets and Collations”:

> When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

A.11.11 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but ペ requires three bytes, as shown here:

```
+-------------------------+--------------------------+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'ペ') |
```

```
+------------------------+--------------------------+
|                      1 |                        3 |
+------------------------+--------------------------+
```

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

A.11.12. How do I know whether character *X* is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
             (ucs2 CHAR(1) character set ucs2,
              utf8 CHAR(1) character set utf8,
              big5 CHAR(1) character set big5,
              cp932 CHAR(1) character set cp932,
              eucjpms CHAR(1) character set eucjpms,
              euckr CHAR(1) character set euckr,
              gb2312 CHAR(1) character set gb2312,
              gbk CHAR(1) character set gbk,
              sjis CHAR(1) character set sjis,
              ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
              big5=ucs2,
              cp932=ucs2,
              eucjpms=ucs2,
              euckr=ucs2,
              gb2312=ucs2,
              gbk=ucs2,
              sjis=ucs2,
              ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
```

```
      hex(sjis) AS sjis,
      hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

DELIMITER ;
```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the Katakana character *Pe* appears in all CJK character sets, and that its code value is `X'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(X'30DA');
+------+--------+------+-------+---------+-------+--------+------+------+------+
| ucs2 | utf8   | big5 | cp932 | eucjpms | euckr | gb2312 | gbk  | sjis | ujis |
+------+--------+------+-------+---------+-------+--------+------+------+------+
| 30DA | E3839A | C772 | 8379  | A5DA    | ABDA  | A5DA   | A5DA | 8379 | A5DA |
+------+--------+------+-------+---------+-------+--------+------+------+------+
```

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

A.11.13. Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

A.11.14. Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

A.11.15. Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane / Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

  The `utf8` character set permits only `UTF-8` characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL must truncate an input string when it encounters bytes that it does no understand. Otherwise, it is unknown how long the bad multibyte character is.

  One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

A.11.16. Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in Section 10.1.10.1, “Unicode Character Sets”.

A.11.17 Does MySQL permit CJK characters to be used in database and table names?

Yes.

A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from http://dev.mysql.com/doc/.

A.11.19 Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups.
- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.
- Visit the MySQL Character Sets, Collation, Unicode Forum. http://forums.mysql.com/ also provides foreign-language forums.

A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 27.7.25, “C API Common Issues”
- Common Problems with MySQL and PHP
- Connector/ODBC Notes and Tips
- Connector/Net Programming
- MySQL Connector/J 5.1 Developer Guide

A.13 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.13.1 Must the slave be connected to the master all the time? 3499
A.13.2 Must I enable networking on my master and slave to enable replication? 3499
A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave? 3499
A.13.4 How do I force the master to block updates until the slave catches up? 3499
A.13.5 What issues should I be aware of when setting up two-way replication? 3500
A.13.6 How can I use replication to improve performance of my system? 3500
A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? 3500
A.13.8 When and how much can MySQL replication improve the performance of my system? 3500
A.13.9 How can I use replication to provide redundancy or high availability? 3501
A.13.10 How do I tell whether a master server is using statement-based or row-based binary logging format? 3501
A.13.11 How do I tell a slave to use row-based replication? 3501
A.13.12 How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines? 3502
A.13.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)? 3502

A.13.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)? 3502

A.13.1 Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

A.13.2 Must I enable networking on my master and slave to enable replication?

Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Check that the `skip-networking` option has not been enabled in the configuration file for either server.

A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the `Seconds_Behind_Master` column in the output from `SHOW SLAVE STATUS`. See Section 18.1.7.1, “Checking Replication Status”.

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately see large `Time` values such as 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old. See Section 18.2.2, “Replication Implementation Details”.

A.13.4 How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

   Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

   The `SELECT` statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

A.13.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

A.13.6 How can I use replication to improve performance of my system?

Set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the `--skip-innodb`, `--low-priority-updates`, and `--delay-key-write=ALL` options to get speed improvements on the slave end. In this case, the slave uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, Section 18.3.5, “Using Replication for Scale-Out”.

A.13.8 When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is 1200 - 2 * `writes`. In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the master and each slave have the same capacity, and that we have one master and *`N`* slaves. Then we have for each server (master or slave):

`reads` = 1200 - 2 * `writes`

`reads` = 9 * `writes` / (*`N`* + 1) (reads are split, but writes replicated to all slaves)

9 * `writes` / (*N* + 1) + 2 * `writes` = 1200

`writes` = 1200 / (2 + 9/(*N* + 1))

The last equation indicates the maximum number of writes for *N* slaves, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If *N* = 0 (which means we have no replication), our system can handle about 1200/11 = 109 writes per second.
- If *N* = 1, we get up to 184 writes per second.
- If *N* = 8, we get up to 400 writes per second.
- If *N* = 17, we get up to 480 writes per second.
- Eventually, as *N* approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add *N* replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many slaves do you have bandwidth available on your network?

A.13.9. How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see Section 18.3.8, “Switching Masters During Failover”.

A.13.10. How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see Section 5.4.4.3, “Mixed Binary Logging Format”.

A.13.11. How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

A.13.12 How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

A.13.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?

Yes.

A.13.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

A.14 MySQL 8.0 FAQ: InnoDB Change Buffer

A.14.1 What types of operations modify secondary indexes and result in change buffering? 3502
A.14.2 What is the benefit of the `InnoDB` change buffer? 3502
A.14.3 Does the change buffer support other types of indexes? 3502
A.14.4 How much space does `InnoDB` use for the change buffer? 3502
A.14.5 How do I determine the current size of the change buffer? 3503
A.14.6 When does change buffer merging occur? 3503
A.14.7 When is the change buffer flushed? 3503
A.14.8 When should the change buffer be used? 3503
A.14.9 When should the change buffer not be used? 3503
A.14.10 Where can I find additional information about the change buffer? 3503

A.14.1 What types of operations modify secondary indexes and result in change buffering?

`INSERT`, `UPDATE`, and `DELETE` operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

A.14.2 What is the benefit of the `InnoDB` change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

A.14.3 Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

A.14.4 How much space does `InnoDB` use for the change buffer?

Prior to the introduction of the `innodb_change_buffer_max_size` configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the `InnoDB` buffer pool size.

In MySQL 5.6 and later, the `innodb_change_buffer_max_size` configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, `innodb_change_buffer_max_size` is set to 25. The maximum setting is 50.

`InnoDB` does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

A.14.5 How do I determine the current size of the change buffer?

The current size of the change buffer is reported by `SHOW ENGINE INNODB STATUS \G`, under the `INSERT BUFFER AND ADAPTIVE HASH INDEX` heading. For example:

```
-------------------------------------
INSERT BUFFER AND ADAPTIVE HASH INDEX
-------------------------------------
Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- `size`: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.
- `seg size`: The size of the change buffer, in pages.

For information about monitoring change buffer status, see Section 15.4.2, “Change Buffer”.

A.14.6 When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by `InnoDB` background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

A.14.7 When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

A.14.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the `InnoDB` buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

A.14.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the `InnoDB` buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

A.14.10 Where can I find additional information about the change buffer?

The following sections and blog post provide additional information about the `InnoDB` change buffer:

- Section 15.4.2, “Change Buffer”
- Section 15.6.4, “Configuring InnoDB Change Buffering”
- MySQL 5.5: InnoDB Change Buffering

A.15 MySQL 8.0 FAQ: InnoDB Tablespace Encryption

A.15.1 Is data decrypted for users who are authorized to see it? 3504
A.15.2 What is the overhead associated with InnoDB tablespace encryption? 3504
A.15.3 What are the encryption algorithms used with InnoDB tablespace encryption? 3504
A.15.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB tablespace encryption feature? 3504
A.15.5 Can indexed columns be encrypted? 3504
A.15.6 What data types and data lengths does InnoDB tablespace encryption support? 3504
A.15.7 Does data remain encrypted on the network? 3505
A.15.8 Does database memory contain clear-text or encrypted data? 3505
A.15.9 How do I know which data to encrypt? 3505
A.15.10 How is InnoDB tablespace encryption different from encryption functions MySQL already provides? 3505
A.15.11 Does the transportable tablespaces feature work with InnoDB tablespace encryption? ... 3505
A.15.12 Does compression work with InnoDB tablespace encryption? 3505
A.15.13 Can I use mysqlpump or mysqldump with encrypted tables? 3505
A.15.14 How do I change (rotate, re-key) the master encryption key? 3505
A.15.15 How do I migrate data from a clear-text InnoDB tablespace to an encrypted InnoDB tablespace? 3505

A.15.1 Is data decrypted for users who are authorized to see it?

Yes. InnoDB tablespace encryption is designed to provide customers with the ability to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. InnoDB tablespace encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

A.15.2 What is the overhead associated with InnoDB tablespace encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

A.15.3 What are the encryption algorithms used with InnoDB tablespace encryption?

InnoDB tablespace encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

A.15.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB tablespace encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

A.15.5 Can indexed columns be encrypted?

InnoDB tablespace encryption supports all indexes transparently.

A.15.6 What data types and data lengths does InnoDB tablespace encryption support?

`InnoDB` tablespace encryption supports all supported data types. There is no data length limitation.

A.15.7 Does data remain encrypted on the network?

Data encrypted by the `InnoDB` tablespace encryption feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in clear-text form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

A.15.8 Does database memory contain clear-text or encrypted data?

With `InnoDB` tablespace encryption, in-memory data is decrypted, which provides 100% transparency.

A.15.9 How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

A.15.10 How is `InnoDB` tablespace encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. `InnoDB` tablespace encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

A.15.11 Does the transportable tablespaces feature work with `InnoDB` tablespace encryption?

Yes. For more information, see Exporting Encrypted Tables.

A.15.12 Does compression work with `InnoDB` tablespace encryption?

Customers using `InnoDB` tablespace encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

A.15.13 Can I use `mysqlpump` or `mysqldump` with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

A.15.14 How do I change (rotate, re-key) the master encryption key?

`InnoDB` tablespace encryption uses a two tier key mechanism. When tablespace encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the `ALTER INSTANCE ROTATE INNODB MASTER KEY` statement, which generates a new master encryption key, stores the key, and rotates the key into use.

A.15.15 How do I migrate data from a clear-text `InnoDB` tablespace to an encrypted `InnoDB` tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an `InnoDB` tablespace, run `ALTER TABLE tbl_name ENCRYPTION='Y'`. `InnoDB` tablespace encryption is only supported with file-per-table tablespaces.

A.16 MySQL 8.0 FAQ: Virtualization Support

A.16.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? 3506

A.16.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for Oracle VM. Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

Appendix B Errors, Error Codes, and Common Problems

Table of Contents

B.1 Sources of Error Information 3507
B.2 Types of Error Values 3507
B.3 Server Error Codes and Messages 3508
B.4 Client Error Codes and Messages 3680
B.5 Problems and Common Errors 3685
B.5.1 How to Determine What Is Causing a Problem 3685
B.5.2 Common Errors When Using MySQL Programs 3686
B.5.3 Administration-Related Issues 3698
B.5.4 Query-Related Issues 3706
B.5.5 Optimizer-Related Issues 3713
B.5.6 Table Definition-Related Issues 3713
B.5.7 Known Issues in MySQL 3714

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided: One list displays server error messages. Another list displays client program messages.

B.1 Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in Section B.2, “Types of Error Values”. These errors are returned from the server side; see Section B.3, “Server Error Codes and Messages”.
- Errors can occur on the client side, usually involving problems communicating with the server; see Section B.4, “Client Error Codes and Messages”.
- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes. The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See Section 13.6.7.3, “GET DIAGNOSTICS Syntax”.
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an `InnoDB` table fails.
- The `perror` program provides information from the command line about error numbers. See Section 4.8.2, “`perror` — Explain Error Codes”.

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to `InnoDB`, see Section 15.20.4, “InnoDB Error Handling”.

B.2 Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.

- An SQLSTATE value. The value is a five-character string (for example, `'42S02'`). The values are taken from ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, the MySQL error code, SQLSTATE value, and message string are available using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in Section 27.7, “MySQL C API”.

The number of errors, warnings, and notes for the previous statement can be obtained by calling `mysql_warning_count()`. See Section 27.7.7.81, “mysql_warning_count()”.

The first two characters of an SQLSTATE value indicate the error class:

- Class = `'00'` indicates success.
- Class = `'01'` indicates a warning.
- Class = `'02'` indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
- Class > `'02'` indicates an exception.

B.3 Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are taken from ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers have corresponding SQLSTATE values. In these cases, `'HY000'` (general error) is used.
- A message string that provides a textual description of the error.

For error checking, use error codes, not error messages. Error messages do not change often, but it is possible. Also if the database administrator changes the language setting, that affects the language of error messages.

Error codes are stable across GA releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and subject to change.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals Manual.

- Error message information is listed in the `share/errmsg-utf8.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg-utf8.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ername.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg-utf8.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1002` SQLSTATE: `HY000` (`ER_NO`)

  Message: NO

  Used in the construction of other messages.

- Error: `1003` SQLSTATE: `HY000` (`ER_YES`)

  Message: YES

  Used in the construction of other messages.

  Extended `EXPLAIN` format generates Note messages. `ER_YES` is used in the `Code` column for these messages in subsequent `SHOW WARNINGS` output.

- Error: `1004` SQLSTATE: `HY000` (`ER_CANT_CREATE_FILE`)

  Message: Can't create file '%s' (errno: %d - %s)

  Occurs for failure to create or copy a file needed for some operation.

  Possible causes: Permissions problem for source file; destination file already exists but is not writeable.

- Error: `1005` SQLSTATE: `HY000` (`ER_CANT_CREATE_TABLE`)

  Message: Can't create table '%s' (errno: %d - %s)

  `InnoDB` reports this error when a table cannot be created. If the error message refers to error 150, table creation failed because a foreign key constraint was not correctly formed. If the error message refers to error −1, table creation probably failed because the table includes a column name that matched the name of an internal `InnoDB` table.

- Error: `1006` SQLSTATE: `HY000` (`ER_CANT_CREATE_DB`)

  Message: Can't create database '%s' (errno: %d - %s)

- Error: `1007` SQLSTATE: `HY000` (`ER_DB_CREATE_EXISTS`)

  Message: Can't create database '%s'; database exists

  An attempt to create a database failed because the database already exists.

  Drop the database first if you really want to replace an existing database, or add an `IF NOT EXISTS` clause to the `CREATE DATABASE` statement if to retain an existing database without having the statement produce an error.

- Error: `1008` SQLSTATE: `HY000` (`ER_DB_DROP_EXISTS`)

  Message: Can't drop database '%s'; database doesn't exist

- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)

  Message: Error dropping database (can't rmdir '%s', errno: %d - %s)

- Error: 1012 SQLSTATE: HY000 (ER_CANT_FIND_SYSTEM_REC)

  Message: Can't read record in system table

  Returned by InnoDB for attempts to access InnoDB INFORMATION_SCHEMA tables when InnoDB is unavailable.

- Error: 1013 SQLSTATE: HY000 (ER_CANT_GET_STAT)

  Message: Can't get status of '%s' (errno: %d - %s)

- Error: 1015 SQLSTATE: HY000 (ER_CANT_LOCK)

  Message: Can't lock file (errno: %d - %s)

- Error: 1016 SQLSTATE: HY000 (ER_CANT_OPEN_FILE)

  Message: Can't open file: '%s' (errno: %d - %s)

  InnoDB reports this error when the table from the InnoDB data files cannot be found.

- Error: 1017 SQLSTATE: HY000 (ER_FILE_NOT_FOUND)

  Message: Can't find file: '%s' (errno: %d - %s)

- Error: 1018 SQLSTATE: HY000 (ER_CANT_READ_DIR)

  Message: Can't read dir of '%s' (errno: %d - %s)

- Error: 1020 SQLSTATE: HY000 (ER_CHECKREAD)

  Message: Record has changed since last read in table '%s'

- Error: 1022 SQLSTATE: 23000 (ER_DUP_KEY)

  Message: Can't write; duplicate key in table '%s'

- Error: 1024 SQLSTATE: HY000 (ER_ERROR_ON_READ)

  Message: Error reading file '%s' (errno: %d - %s)

- Error: 1025 SQLSTATE: HY000 (ER_ERROR_ON_RENAME)

  Message: Error on rename of '%s' to '%s' (errno: %d - %s)

- Error: 1026 SQLSTATE: HY000 (ER_ERROR_ON_WRITE)

  Message: Error writing file '%s' (errno: %d - %s)

- Error: 1027 SQLSTATE: HY000 (ER_FILE_USED)

  Message: '%s' is locked against change

- Error: 1028 SQLSTATE: HY000 (ER_FILSORT_ABORT)

  Message: Sort aborted

- Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)

  Message: Got error %d - '%s' from storage engine

Check the %d value to see what the OS error means. For example, 28 indicates that you have run out of disk space.

- Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)

  Message: Table storage engine for '%s' doesn't have this option

- Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)

  Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)

  Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)

  Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)

  Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)

  Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)

  Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)

  Message: Out of sort memory, consider increasing server sort buffer size

- Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)

  Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)

  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)

  Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER_HANDSHAKE_ERROR)

  Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER_DBACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER_ACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 (ER_NO_DB_ERROR)

  Message: No database selected

- Error: 1047 SQLSTATE: 08S01 (ER_UNKNOWN_COM_ERROR)

Message: Unknown command

- Error: 1048 SQLSTATE: 23000 (ER_BAD_NULL_ERROR)

  Message: Column '%s' cannot be null

- Error: 1049 SQLSTATE: 42000 (ER_BAD_DB_ERROR)

  Message: Unknown database '%s'

- Error: 1050 SQLSTATE: 42S01 (ER_TABLE_EXISTS_ERROR)

  Message: Table '%s' already exists

- Error: 1051 SQLSTATE: 42S02 (ER_BAD_TABLE_ERROR)

  Message: Unknown table '%s'

- Error: 1052 SQLSTATE: 23000 (ER_NON_UNIQ_ERROR)

  Message: Column '%s' in %s is ambiguous

  ```
  %s = column name
  %s = location of column (for example, "field list")
  ```

  Likely cause: A column appears in a query without appropriate qualification, such as in a select list or ON clause.

  Examples:

  ```
  mysql> SELECT i FROM t INNER JOIN t AS t2;
  ERROR 1052 (23000): Column 'i' in field list is ambiguous

  mysql> SELECT * FROM t LEFT JOIN t AS t2 ON i = i;
  ERROR 1052 (23000): Column 'i' in on clause is ambiguous
  ```

  Resolution:

  - Qualify the column with the appropriate table name:

    ```
    mysql> SELECT t2.i FROM t INNER JOIN t AS t2;
    ```

  - Modify the query to avoid the need for qualification:

    ```
    mysql> SELECT * FROM t LEFT JOIN t AS t2 USING (i);
    ```

- Error: 1053 SQLSTATE: 08S01 (ER_SERVER_SHUTDOWN)

  Message: Server shutdown in progress

- Error: 1054 SQLSTATE: 42S22 (ER_BAD_FIELD_ERROR)

  Message: Unknown column '%s' in '%s'

- Error: 1055 SQLSTATE: 42000 (ER_WRONG_FIELD_WITH_GROUP)

  Message: '%s' isn't in GROUP BY

- Error: 1056 SQLSTATE: 42000 (ER_WRONG_GROUP_FIELD)

  Message: Can't group on '%s'

- Error: 1057 SQLSTATE: 42000 (ER_WRONG_SUM_SELECT)

  Message: Statement has sum functions and columns in same statement
- Error: 1058 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT)

  Message: Column count doesn't match value count
- Error: 1059 SQLSTATE: 42000 (ER_TOO_LONG_IDENT)

  Message: Identifier name '%s' is too long
- Error: 1060 SQLSTATE: 42S21 (ER_DUP_FIELDNAME)

  Message: Duplicate column name '%s'
- Error: 1061 SQLSTATE: 42000 (ER_DUP_KEYNAME)

  Message: Duplicate key name '%s'
- Error: 1062 SQLSTATE: 23000 (ER_DUP_ENTRY)

  Message: Duplicate entry '%s' for key %d

  The message returned with this error uses the format string for ER_DUP_ENTRY_WITH_KEY_NAME.
- Error: 1063 SQLSTATE: 42000 (ER_WRONG_FIELD_SPEC)

  Message: Incorrect column specifier for column '%s'
- Error: 1064 SQLSTATE: 42000 (ER_PARSE_ERROR)

  Message: %s near '%s' at line %d
- Error: 1065 SQLSTATE: 42000 (ER_EMPTY_QUERY)

  Message: Query was empty
- Error: 1066 SQLSTATE: 42000 (ER_NONUNIQ_TABLE)

  Message: Not unique table/alias: '%s'
- Error: 1067 SQLSTATE: 42000 (ER_INVALID_DEFAULT)

  Message: Invalid default value for '%s'
- Error: 1068 SQLSTATE: 42000 (ER_MULTIPLE_PRI_KEY)

  Message: Multiple primary key defined
- Error: 1069 SQLSTATE: 42000 (ER_TOO_MANY_KEYS)

  Message: Too many keys specified; max %d keys allowed
- Error: 1070 SQLSTATE: 42000 (ER_TOO_MANY_KEY_PARTS)

  Message: Too many key parts specified; max %d parts allowed
- Error: 1071 SQLSTATE: 42000 (ER_TOO_LONG_KEY)

  Message: Specified key was too long; max key length is %d bytes
- Error: 1072 SQLSTATE: 42000 (ER_KEY_COLUMN_DOES_NOT_EXITS)

  Message: Key column '%s' doesn't exist in table

- Error: 1073 SQLSTATE: 42000 (ER_BLOB_USED_AS_KEY)

  Message: BLOB column '%s' can't be used in key specification with the used table type

- Error: 1074 SQLSTATE: 42000 (ER_TOO_BIG_FIELDLENGTH)

  Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead

- Error: 1075 SQLSTATE: 42000 (ER_WRONG_AUTO_KEY)

  Message: Incorrect table definition; there can be only one auto column and it must be defined as a key

- Error: 1076 SQLSTATE: HY000 (ER_READY)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error: 1077 SQLSTATE: HY000 (ER_NORMAL_SHUTDOWN)

  Message: %s: Normal shutdown

- Error: 1079 SQLSTATE: HY000 (ER_SHUTDOWN_COMPLETE)

  Message: %s: Shutdown complete

- Error: 1080 SQLSTATE: 08S01 (ER_FORCING_CLOSE)

  Message: %s: Forcing close of thread %ld user: '%s'

- Error: 1081 SQLSTATE: 08S01 (ER_IPSOCK_ERROR)

  Message: Can't create IP socket

- Error: 1082 SQLSTATE: 42S12 (ER_NO_SUCH_INDEX)

  Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table

- Error: 1083 SQLSTATE: 42000 (ER_WRONG_FIELD_TERMINATORS)

  Message: Field separator argument is not what is expected; check the manual

- Error: 1084 SQLSTATE: 42000 (ER_BLOBS_AND_NO_TERMINATED)

  Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

- Error: 1085 SQLSTATE: HY000 (ER_TEXTFILE_NOT_READABLE)

  Message: The file '%s' must be in the database directory or be readable by all

- Error: 1086 SQLSTATE: HY000 (ER_FILE_EXISTS_ERROR)

  Message: File '%s' already exists

- Error: 1087 SQLSTATE: HY000 (ER_LOAD_INFO)

  Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld

- Error: 1088 SQLSTATE: HY000 (ER_ALTER_INFO)

  Message: Records: %ld Duplicates: %ld

- Error: 1089 SQLSTATE: HY000 (ER_WRONG_SUB_KEY)

  Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys

- Error: 1090 SQLSTATE: 42000 (ER_CANT_REMOVE_ALL_FIELDS)

  Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead

- Error: 1091 SQLSTATE: 42000 (ER_CANT_DROP_FIELD_OR_KEY)

  Message: Can't DROP '%s'; check that column/key exists

- Error: 1092 SQLSTATE: HY000 (ER_INSERT_INFO)

  Message: Records: %ld Duplicates: %ld Warnings: %ld

- Error: 1093 SQLSTATE: HY000 (ER_UPDATE_TABLE_USED)

  Message: You can't specify target table '%s' for update in FROM clause

  This error occurs for attempts to select from and modify the same table within a single statement. If the select attempt occurs within a derived table, you can avoid this error by setting the `derived_merge` flag of the `optimizer_switch` system variable to force the subquery to be materialized into a temporary table, which effectively causes it to be a different table from the one modified. See Section 8.2.2.3, “Optimizing Derived Tables, View References, and Common Table Expressions”.

- Error: 1094 SQLSTATE: HY000 (ER_NO_SUCH_THREAD)

  Message: Unknown thread id: %lu

- Error: 1095 SQLSTATE: HY000 (ER_KILL_DENIED_ERROR)

  Message: You are not owner of thread %lu

- Error: 1096 SQLSTATE: HY000 (ER_NO_TABLES_USED)

  Message: No tables used

- Error: 1097 SQLSTATE: HY000 (ER_TOO_BIG_SET)

  Message: Too many strings for column %s and SET

- Error: 1098 SQLSTATE: HY000 (ER_NO_UNIQUE_LOGFILE)

  Message: Can't generate a unique log-filename %s.(1-999)

- Error: 1099 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED_FOR_WRITE)

  Message: Table '%s' was locked with a READ lock and can't be updated

- Error: 1100 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED)

  Message: Table '%s' was not locked with LOCK TABLES

- Error: 1101 SQLSTATE: 42000 (ER_BLOB_CANT_HAVE_DEFAULT)

  Message: BLOB, TEXT, GEOMETRY or JSON column '%s' can't have a default value

- Error: 1102 SQLSTATE: 42000 (ER_WRONG_DB_NAME)

  Message: Incorrect database name '%s'

- Error: 1103 SQLSTATE: 42000 (ER_WRONG_TABLE_NAME)

  Message: Incorrect table name '%s'

- Error: 1104 SQLSTATE: 42000 (ER_TOO_BIG_SELECT)

Message: The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET MAX_JOIN_SIZE=# if the SELECT is okay

- Error: 1105 SQLSTATE: HY000 (ER_UNKNOWN_ERROR)

  Message: Unknown error

- Error: 1106 SQLSTATE: 42000 (ER_UNKNOWN_PROCEDURE)

  Message: Unknown procedure '%s'

- Error: 1107 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_PROCEDURE)

  Message: Incorrect parameter count to procedure '%s'

- Error: 1108 SQLSTATE: HY000 (ER_WRONG_PARAMETERS_TO_PROCEDURE)

  Message: Incorrect parameters to procedure '%s'

- Error: 1109 SQLSTATE: 42S02 (ER_UNKNOWN_TABLE)

  Message: Unknown table '%s' in %s

- Error: 1110 SQLSTATE: 42000 (ER_FIELD_SPECIFIED_TWICE)

  Message: Column '%s' specified twice

- Error: 1111 SQLSTATE: HY000 (ER_INVALID_GROUP_FUNC_USE)

  Message: Invalid use of group function

- Error: 1112 SQLSTATE: 42000 (ER_UNSUPPORTED_EXTENSION)

  Message: Table '%s' uses an extension that doesn't exist in this MySQL version

- Error: 1113 SQLSTATE: 42000 (ER_TABLE_MUST_HAVE_COLUMNS)

  Message: A table must have at least 1 column

- Error: 1114 SQLSTATE: HY000 (ER_RECORD_FILE_FULL)

  Message: The table '%s' is full

  InnoDB reports this error when the system tablespace runs out of free space. Reconfigure the system tablespace to add a new data file.

- Error: 1115 SQLSTATE: 42000 (ER_UNKNOWN_CHARACTER_SET)

  Message: Unknown character set: '%s'

- Error: 1116 SQLSTATE: HY000 (ER_TOO_MANY_TABLES)

  Message: Too many tables; MySQL can only use %d tables in a join

- Error: 1117 SQLSTATE: HY000 (ER_TOO_MANY_FIELDS)

  Message: Too many columns

- Error: 1118 SQLSTATE: 42000 (ER_TOO_BIG_ROWSIZE)

  Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. This includes storage overhead, check the manual. You have to change some columns to TEXT or BLOBs

- Error: 1119 SQLSTATE: HY000 (ER_STACK_OVERRUN)

  Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld --thread_stack=#' to specify a bigger stack if needed

- Error: 1120 SQLSTATE: 42000 (ER_WRONG_OUTER_JOIN)

  Message: Cross dependency found in OUTER JOIN; examine your ON conditions

  ER_WRONG_OUTER_JOIN was removed after 8.0.0.

- Error: 1120 SQLSTATE: 42000 (ER_WRONG_OUTER_JOIN_UNUSED)

  Message: Cross dependency found in OUTER JOIN; examine your ON conditions

  ER_WRONG_OUTER_JOIN_UNUSED was added in 8.0.1.

- Error: 1121 SQLSTATE: 42000 (ER_NULL_COLUMN_IN_INDEX)

  Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler

- Error: 1122 SQLSTATE: HY000 (ER_CANT_FIND_UDF)

  Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER_CANT_INITIALIZE_UDF)

  Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER_UDF_NO_PATHS)

  Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER_UDF_EXISTS)

  Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER_CANT_OPEN_LIBRARY)

  Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER_CANT_FIND_DL_ENTRY)

  Message: Can't find symbol '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER_FUNCTION_NOT_DEFINED)

  Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER_HOST_IS_BLOCKED)

  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)

  Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)

  Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

  Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

  Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

  Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

  Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

  Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

  Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER_INVALID_USE_OF_NULL)

  Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

  Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

  Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

  Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)

  Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)

  Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)

  Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)

  Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)

  Message: Got a packet bigger than 'max_allowed_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)

  Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)

  Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)

  Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)

  Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)

  Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)

  Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)

  Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)

  Message: Got timeout writing communication packets

- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)

  Message: Result string is longer than 'max_allowed_packet' bytes

- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)

  Message: The used table type doesn't support BLOB/TEXT columns

- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)

  Message: The used table type doesn't support AUTO_INCREMENT columns

- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)

  Message: Incorrect column name '%s'

- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)

  Message: The used storage engine can't index column '%s'

- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)

  Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist

- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)

  Message: Can't write, because of unique constraint, to table '%s'

- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)

  Message: BLOB/TEXT column '%s' used in key specification without a key length

- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)

  Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead

- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)

  Message: Result consisted of more than one row

- Error: 1173 SQLSTATE: 42000 (ER_REQUIRES_PRIMARY_KEY)

  Message: This table type requires a primary key

- Error: 1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)

  Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column

- Error: 1176 SQLSTATE: 42000 (ER_KEY_DOES_NOT_EXITS)

  Message: Key '%s' doesn't exist in table '%s'

- Error: 1177 SQLSTATE: 42000 (ER_CHECK_NO_SUCH_TABLE)

  Message: Can't open table

- Error: 1178 SQLSTATE: 42000 (ER_CHECK_NOT_IMPLEMENTED)

  Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER_CANT_DO_THIS_DURING_AN_TRANSACTION)

  Message: You are not allowed to execute this command in a transaction

- Error: 1180 SQLSTATE: HY000 (ER_ERROR_DURING_COMMIT)

  Message: Got error %d - '%s' during COMMIT

- Error: 1181 SQLSTATE: HY000 (ER_ERROR_DURING_ROLLBACK)

  Message: Got error %d - '%s' during ROLLBACK

- Error: 1182 SQLSTATE: HY000 (ER_ERROR_DURING_FLUSH_LOGS)

Message: Got error %d during FLUSH_LOGS

- Error: 1184 SQLSTATE: 08S01 (ER_NEW_ABORTING_CONNECTION)

  Message: Aborted connection %u to db: '%s' user: '%s' host: '%s' (%s)

- Error: 1188 SQLSTATE: HY000 (ER_MASTER)

  Message: Error from master: '%s'

- Error: 1189 SQLSTATE: 08S01 (ER_MASTER_NET_READ)

  Message: Net error reading from master

- Error: 1190 SQLSTATE: 08S01 (ER_MASTER_NET_WRITE)

  Message: Net error writing to master

- Error: 1191 SQLSTATE: HY000 (ER_FT_MATCHING_KEY_NOT_FOUND)

  Message: Can't find FULLTEXT index matching the column list

- Error: 1192 SQLSTATE: HY000 (ER_LOCK_OR_ACTIVE_TRANSACTION)

  Message: Can't execute the given command because you have active locked tables or an active transaction

- Error: 1193 SQLSTATE: HY000 (ER_UNKNOWN_SYSTEM_VARIABLE)

  Message: Unknown system variable '%s'

- Error: 1194 SQLSTATE: HY000 (ER_CRASHED_ON_USAGE)

  Message: Table '%s' is marked as crashed and should be repaired

- Error: 1195 SQLSTATE: HY000 (ER_CRASHED_ON_REPAIR)

  Message: Table '%s' is marked as crashed and last (automatic?) repair failed

- Error: 1196 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK)

  Message: Some non-transactional changed tables couldn't be rolled back

- Error: 1197 SQLSTATE: HY000 (ER_TRANS_CACHE_FULL)

  Message: Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1199 SQLSTATE: HY000 (ER_SLAVE_NOT_RUNNING)

  Message: This operation requires a running slave; configure slave and do START SLAVE

- Error: 1200 SQLSTATE: HY000 (ER_BAD_SLAVE)

  Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO

- Error: 1201 SQLSTATE: HY000 (ER_MASTER_INFO)

  Message: Could not initialize master info structure; more error messages can be found in the MySQL error log

- Error: 1202 SQLSTATE: HY000 (ER_SLAVE_THREAD)

  Message: Could not create slave thread; check system resources

- Error: 1203 SQLSTATE: 42000 (ER_TOO_MANY_USER_CONNECTIONS)

  Message: User %s already has more than 'max_user_connections' active connections

- Error: 1204 SQLSTATE: HY000 (ER_SET_CONSTANTS_ONLY)

  Message: You may only use constant expressions with SET

- Error: 1205 SQLSTATE: HY000 (ER_LOCK_WAIT_TIMEOUT)

  Message: Lock wait timeout exceeded; try restarting transaction

  InnoDB reports this error when lock wait timeout expires. The statement that waited too long was rolled back (not the entire transaction). You can increase the value of the innodb_lock_wait_timeout configuration option if SQL statements should wait longer for other transactions to complete, or decrease it if too many long-running transactions are causing locking problems and reducing concurrency on a busy system.

- Error: 1206 SQLSTATE: HY000 (ER_LOCK_TABLE_FULL)

  Message: The total number of locks exceeds the lock table size

  InnoDB reports this error when the total number of locks exceeds the amount of memory devoted to managing locks. To avoid this error, increase the value of innodb_buffer_pool_size. Within an individual application, a workaround may be to break a large operation into smaller pieces. For example, if the error occurs for a large INSERT, perform several smaller INSERT operations.

- Error: 1207 SQLSTATE: 25000 (ER_READ_ONLY_TRANSACTION)

  Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

- Error: 1210 SQLSTATE: HY000 (ER_WRONG_ARGUMENTS)

  Message: Incorrect arguments to %s

- Error: 1211 SQLSTATE: 42000 (ER_NO_PERMISSION_TO_CREATE_USER)

  Message: '%s'@'%s' is not allowed to create new users

- Error: 1213 SQLSTATE: 40001 (ER_LOCK_DEADLOCK)

  Message: Deadlock found when trying to get lock; try restarting transaction

  InnoDB reports this error when a transaction encounters a deadlock and is automatically rolled back so that your application can take corrective action. To recover from this error, run all the operations in this transaction again. A deadlock occurs when requests for locks arrive in inconsistent order between transactions. The transaction that was rolled back released all its locks, and the other transaction can now get all the locks it requested. Thus, when you re-run the transaction that was rolled back, it might have to wait for other transactions to complete, but typically the deadlock does not recur. If you encounter frequent deadlocks, make the sequence of locking operations (LOCK TABLES, SELECT ... FOR UPDATE, and so on) consistent between the different transactions or applications that experience the issue. See Section 15.5.5, “Deadlocks in InnoDB” for details.

- Error: 1214 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_FT)

  Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN)

  Message: Cannot add foreign key constraint

- Error: 1216 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW)

Message: Cannot add or update a child row: a foreign key constraint fails

`InnoDB` reports this error when you try to add a row but there is no parent row, and a foreign key constraint fails. Add the parent row first.

- Error: `1217` SQLSTATE: `23000` (`ER_ROW_IS_REFERENCED`)

  Message: Cannot delete or update a parent row: a foreign key constraint fails

  `InnoDB` reports this error when you try to delete a parent row that has children, and a foreign key constraint fails. Delete the children first.

- Error: `1218` SQLSTATE: `08S01` (`ER_CONNECT_TO_MASTER`)

  Message: Error connecting to master: %s

- Error: `1220` SQLSTATE: `HY000` (`ER_ERROR_WHEN_EXECUTING_COMMAND`)

  Message: Error when executing command %s: %s

- Error: `1221` SQLSTATE: `HY000` (`ER_WRONG_USAGE`)

  Message: Incorrect usage of %s and %s

- Error: `1222` SQLSTATE: `21000` (`ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT`)

  Message: The used SELECT statements have a different number of columns

- Error: `1223` SQLSTATE: `HY000` (`ER_CANT_UPDATE_WITH_READLOCK`)

  Message: Can't execute the query because you have a conflicting read lock

- Error: `1224` SQLSTATE: `HY000` (`ER_MIXING_NOT_ALLOWED`)

  Message: Mixing of transactional and non-transactional tables is disabled

- Error: `1225` SQLSTATE: `HY000` (`ER_DUP_ARGUMENT`)

  Message: Option '%s' used twice in statement

- Error: `1226` SQLSTATE: `42000` (`ER_USER_LIMIT_REACHED`)

  Message: User '%s' has exceeded the '%s' resource (current value: %ld)

- Error: `1227` SQLSTATE: `42000` (`ER_SPECIFIC_ACCESS_DENIED_ERROR`)

  Message: Access denied; you need (at least one of) the %s privilege(s) for this operation

- Error: `1228` SQLSTATE: `HY000` (`ER_LOCAL_VARIABLE`)

  Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL

- Error: `1229` SQLSTATE: `HY000` (`ER_GLOBAL_VARIABLE`)

  Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL

- Error: `1230` SQLSTATE: `42000` (`ER_NO_DEFAULT`)

  Message: Variable '%s' doesn't have a default value

- Error: `1231` SQLSTATE: `42000` (`ER_WRONG_VALUE_FOR_VAR`)

  Message: Variable '%s' can't be set to the value of '%s'

- Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)

  Message: Incorrect argument type to variable '%s'
- Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)

  Message: Variable '%s' can only be set, not read
- Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)

  Message: Incorrect usage/placement of '%s'
- Error: 1235 SQLSTATE: 42000 (ER_NOT_SUPPORTED_YET)

  Message: This version of MySQL doesn't yet support '%s'
- Error: 1236 SQLSTATE: HY000 (ER_MASTER_FATAL_ERROR_READING_BINLOG)

  Message: Got fatal error %d from master when reading data from binary log: '%s'
- Error: 1237 SQLSTATE: HY000 (ER_SLAVE_IGNORED_TABLE)

  Message: Slave SQL thread ignored the query because of replicate-*-table rules
- Error: 1238 SQLSTATE: HY000 (ER_INCORRECT_GLOBAL_LOCAL_VAR)

  Message: Variable '%s' is a %s variable
- Error: 1239 SQLSTATE: 42000 (ER_WRONG_FK_DEF)

  Message: Incorrect foreign key definition for '%s': %s
- Error: 1240 SQLSTATE: HY000 (ER_KEY_REF_DO_NOT_MATCH_TABLE_REF)

  Message: Key reference and table reference don't match
- Error: 1241 SQLSTATE: 21000 (ER_OPERAND_COLUMNS)

  Message: Operand should contain %d column(s)
- Error: 1242 SQLSTATE: 21000 (ER_SUBQUERY_NO_1_ROW)

  Message: Subquery returns more than 1 row
- Error: 1243 SQLSTATE: HY000 (ER_UNKNOWN_STMT_HANDLER)

  Message: Unknown prepared statement handler (%.*s) given to %s
- Error: 1244 SQLSTATE: HY000 (ER_CORRUPT_HELP_DB)

  Message: Help database is corrupt or does not exist
- Error: 1246 SQLSTATE: HY000 (ER_AUTO_CONVERT)

  Message: Converting column '%s' from %s to %s
- Error: 1247 SQLSTATE: 42S22 (ER_ILLEGAL_REFERENCE)

  Message: Reference '%s' not supported (%s)
- Error: 1248 SQLSTATE: 42000 (ER_DERIVED_MUST_HAVE_ALIAS)

  Message: Every derived table must have its own alias
- Error: 1249 SQLSTATE: 01000 (ER_SELECT_REDUCED)

Message: Select %u was reduced during optimization

- Error: 1250 SQLSTATE: 42000 (ER_TABLENAME_NOT_ALLOWED_HERE)

  Message: Table '%s' from one of the SELECTs cannot be used in %s

- Error: 1251 SQLSTATE: 08004 (ER_NOT_SUPPORTED_AUTH_MODE)

  Message: Client does not support authentication protocol requested by server; consider upgrading MySQL client

- Error: 1252 SQLSTATE: 42000 (ER_SPATIAL_CANT_HAVE_NULL)

  Message: All parts of a SPATIAL index must be NOT NULL

- Error: 1253 SQLSTATE: 42000 (ER_COLLATION_CHARSET_MISMATCH)

  Message: COLLATION '%s' is not valid for CHARACTER SET '%s'

- Error: 1256 SQLSTATE: HY000 (ER_TOO_BIG_FOR_UNCOMPRESS)

  Message: Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)

- Error: 1257 SQLSTATE: HY000 (ER_ZLIB_Z_MEM_ERROR)

  Message: ZLIB: Not enough memory

- Error: 1258 SQLSTATE: HY000 (ER_ZLIB_Z_BUF_ERROR)

  Message: ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)

- Error: 1259 SQLSTATE: HY000 (ER_ZLIB_Z_DATA_ERROR)

  Message: ZLIB: Input data corrupted

- Error: 1260 SQLSTATE: HY000 (ER_CUT_VALUE_GROUP_CONCAT)

  Message: Row %u was cut by GROUP_CONCAT()

- Error: 1261 SQLSTATE: 01000 (ER_WARN_TOO_FEW_RECORDS)

  Message: Row %ld doesn't contain data for all columns

- Error: 1262 SQLSTATE: 01000 (ER_WARN_TOO_MANY_RECORDS)

  Message: Row %ld was truncated; it contained more data than there were input columns

- Error: 1263 SQLSTATE: 22004 (ER_WARN_NULL_TO_NOTNULL)

  Message: Column set to default value; NULL supplied to NOT NULL column '%s' at row %ld

- Error: 1264 SQLSTATE: 22003 (ER_WARN_DATA_OUT_OF_RANGE)

  Message: Out of range value for column '%s' at row %ld

- Error: 1265 SQLSTATE: 01000 (WARN_DATA_TRUNCATED)

  Message: Data truncated for column '%s' at row %ld

- Error: 1266 SQLSTATE: HY000 (ER_WARN_USING_OTHER_HANDLER)

  Message: Using storage engine %s for table '%s'

- Error: 1267 SQLSTATE: HY000 (ER_CANT_AGGREGATE_2COLLATIONS)

  Message: Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'

- Error: 1269 SQLSTATE: HY000 (ER_REVOKE_GRANTS)

  Message: Can't revoke all privileges for one or more of the requested users

- Error: 1270 SQLSTATE: HY000 (ER_CANT_AGGREGATE_3COLLATIONS)

  Message: Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'

- Error: 1271 SQLSTATE: HY000 (ER_CANT_AGGREGATE_NCOLLATIONS)

  Message: Illegal mix of collations for operation '%s'

- Error: 1272 SQLSTATE: HY000 (ER_VARIABLE_IS_NOT_STRUCT)

  Message: Variable '%s' is not a variable component (can't be used as XXXX.variable_name)

- Error: 1273 SQLSTATE: HY000 (ER_UNKNOWN_COLLATION)

  Message: Unknown collation: '%s'

- Error: 1274 SQLSTATE: HY000 (ER_SLAVE_IGNORED_SSL_PARAMS)

  Message: SSL parameters in CHANGE MASTER are ignored because this MySQL slave was compiled without SSL support; they can be used later if MySQL slave with SSL is started

- Error: 1275 SQLSTATE: HY000 (ER_SERVER_IS_IN_SECURE_AUTH_MODE)

  Message: Server is running in --secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format

- Error: 1276 SQLSTATE: HY000 (ER_WARN_FIELD_RESOLVED)

  Message: Field or reference '%s%s%s%s%s' of SELECT #%d was resolved in SELECT #%d

- Error: 1277 SQLSTATE: HY000 (ER_BAD_SLAVE_UNTIL_COND)

  Message: Incorrect parameter or combination of parameters for START SLAVE UNTIL

- Error: 1278 SQLSTATE: HY000 (ER_MISSING_SKIP_SLAVE)

  Message: It is recommended to use --skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart

- Error: 1279 SQLSTATE: HY000 (ER_UNTIL_COND_IGNORED)

  Message: SQL thread is not to be started so UNTIL options are ignored

- Error: 1280 SQLSTATE: 42000 (ER_WRONG_NAME_FOR_INDEX)

  Message: Incorrect index name '%s'

- Error: 1281 SQLSTATE: 42000 (ER_WRONG_NAME_FOR_CATALOG)

  Message: Incorrect catalog name '%s'

- Error: 1282 SQLSTATE: HY000 (ER_WARN_QC_RESIZE)

  Message: Query cache failed to set size %lu; new query cache size is %lu

  ER_WARN_QC_RESIZE was removed after 8.0.2.

- Error: 1283 SQLSTATE: HY000 (ER_BAD_FT_COLUMN)

  Message: Column '%s' cannot be part of FULLTEXT index

- Error: 1284 SQLSTATE: HY000 (ER_UNKNOWN_KEY_CACHE)

  Message: Unknown key cache '%s'

- Error: 1285 SQLSTATE: HY000 (ER_WARN_HOSTNAME_WONT_WORK)

  Message: MySQL is started in --skip-name-resolve mode; you must restart it without this switch for this grant to work

- Error: 1286 SQLSTATE: 42000 (ER_UNKNOWN_STORAGE_ENGINE)

  Message: Unknown storage engine '%s'

- Error: 1287 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX)

  Message: '%s' is deprecated and will be removed in a future release. Please use %s instead

- Error: 1288 SQLSTATE: HY000 (ER_NON_UPDATABLE_TABLE)

  Message: The target table %s of the %s is not updatable

- Error: 1289 SQLSTATE: HY000 (ER_FEATURE_DISABLED)

  Message: The '%s' feature is disabled; you need MySQL built with '%s' to have it working

- Error: 1290 SQLSTATE: HY000 (ER_OPTION_PREVENTS_STATEMENT)

  Message: The MySQL server is running with the %s option so it cannot execute this statement

- Error: 1291 SQLSTATE: HY000 (ER_DUPLICATED_VALUE_IN_TYPE)

  Message: Column '%s' has duplicated value '%s' in %s

- Error: 1292 SQLSTATE: 22007 (ER_TRUNCATED_WRONG_VALUE)

  Message: Truncated incorrect %s value: '%s'

- Error: 1294 SQLSTATE: HY000 (ER_INVALID_ON_UPDATE)

  Message: Invalid ON UPDATE clause for '%s' column

- Error: 1295 SQLSTATE: HY000 (ER_UNSUPPORTED_PS)

  Message: This command is not supported in the prepared statement protocol yet

- Error: 1296 SQLSTATE: HY000 (ER_GET_ERRMSG)

  Message: Got error %d '%s' from %s

- Error: 1297 SQLSTATE: HY000 (ER_GET_TEMPORARY_ERRMSG)

  Message: Got temporary error %d '%s' from %s

- Error: 1298 SQLSTATE: HY000 (ER_UNKNOWN_TIME_ZONE)

  Message: Unknown or incorrect time zone: '%s'

- Error: 1299 SQLSTATE: HY000 (ER_WARN_INVALID_TIMESTAMP)

  Message: Invalid TIMESTAMP value in column '%s' at row %ld

- Error: 1300 SQLSTATE: HY000 (ER_INVALID_CHARACTER_STRING)

  Message: Invalid %s character string: '%s'

- Error: 1301 SQLSTATE: HY000 (ER_WARN_ALLOWED_PACKET_OVERFLOWED)

  Message: Result of %s() was larger than max_allowed_packet (%ld) - truncated

- Error: 1302 SQLSTATE: HY000 (ER_CONFLICTING_DECLARATIONS)

  Message: Conflicting declarations: '%s%s' and '%s%s'

  Message: View merge algorithm can't be used here for now (assumed undefined algorithm)

- Error: 1355 SQLSTATE: HY000 (ER_WARN_VIEW_WITHOUT_KEY)

  Message: View being updated does not have complete key of underlying table in it

- Error: 1356 SQLSTATE: HY000 (ER_VIEW_INVALID)

  Message: View '%s.%s' references invalid table(s) or column(s) or function(s) or definer/invoker of view lack rights to use them

- Error: 1357 SQLSTATE: HY000 (ER_SP_NO_DROP_SP)

  Message: Can't drop or alter a %s from within another stored routine

- Error: 1359 SQLSTATE: HY000 (ER_TRG_ALREADY_EXISTS)

  Message: Trigger already exists

- Error: 1360 SQLSTATE: HY000 (ER_TRG_DOES_NOT_EXIST)

  Message: Trigger does not exist

- Error: 1361 SQLSTATE: HY000 (ER_TRG_ON_VIEW_OR_TEMP_TABLE)

  Message: Trigger's '%s' is view or temporary table

- Error: 1362 SQLSTATE: HY000 (ER_TRG_CANT_CHANGE_ROW)

  Message: Updating of %s row is not allowed in %strigger

- Error: 1363 SQLSTATE: HY000 (ER_TRG_NO_SUCH_ROW_IN_TRG)

  Message: There is no %s row in %s trigger

- Error: 1364 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_FIELD)

  Message: Field '%s' doesn't have a default value

- Error: 1365 SQLSTATE: 22012 (ER_DIVISION_BY_ZERO)

  Message: Division by 0

- Error: 1366 SQLSTATE: HY000 (ER_TRUNCATED_WRONG_VALUE_FOR_FIELD)

Message: Incorrect %s value: '%s' for column '%s' at row %ld

- Error: 1367 SQLSTATE: 22007 (ER_ILLEGAL_VALUE_FOR_TYPE)

  Message: Illegal %s '%s' value found during parsing

- Error: 1368 SQLSTATE: HY000 (ER_VIEW_NONUPD_CHECK)

  Message: CHECK OPTION on non-updatable view '%s.%s'

- Error: 1369 SQLSTATE: HY000 (ER_VIEW_CHECK_FAILED)

  Message: CHECK OPTION failed '%s.%s'

- Error: 1370 SQLSTATE: 42000 (ER_PROCACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for routine '%s'

- Error: 1371 SQLSTATE: HY000 (ER_RELAY_LOG_FAIL)

  Message: Failed purging old relay logs: %s

- Error: 1373 SQLSTATE: HY000 (ER_UNKNOWN_TARGET_BINLOG)

  Message: Target log not found in binlog index

- Error: 1374 SQLSTATE: HY000 (ER_IO_ERR_LOG_INDEX_READ)

  Message: I/O error reading log index file

- Error: 1375 SQLSTATE: HY000 (ER_BINLOG_PURGE_PROHIBITED)

  Message: Server configuration does not permit binlog purge

- Error: 1376 SQLSTATE: HY000 (ER_FSEEK_FAIL)

  Message: Failed on fseek()

- Error: 1377 SQLSTATE: HY000 (ER_BINLOG_PURGE_FATAL_ERR)

  Message: Fatal error during log purge

- Error: 1378 SQLSTATE: HY000 (ER_LOG_IN_USE)

  Message: A purgeable log is in use, will not purge

- Error: 1379 SQLSTATE: HY000 (ER_LOG_PURGE_UNKNOWN_ERR)

  Message: Unknown error during log purge

- Error: 1380 SQLSTATE: HY000 (ER_RELAY_LOG_INIT)

  Message: Failed initializing relay log position: %s

- Error: 1381 SQLSTATE: HY000 (ER_NO_BINARY_LOGGING)

  Message: You are not using binary logging

- Error: 1382 SQLSTATE: HY000 (ER_RESERVED_SYNTAX)

  Message: The '%s' syntax is reserved for purposes internal to the MySQL server

- Error: 1390 SQLSTATE: HY000 (ER_PS_MANY_PARAM)

  Message: Prepared statement contains too many placeholders

- Error: 1391 SQLSTATE: HY000 (ER_KEY_PART_0)

  Message: Key part '%s' length cannot be 0

- Error: 1392 SQLSTATE: HY000 (ER_VIEW_CHECKSUM)

  Message: View text checksum failed

- Error: 1393 SQLSTATE: HY000 (ER_VIEW_MULTIUPDATE)

  Message: Can not modify more than one base table through a join view '%s.%s'

- Error: 1394 SQLSTATE: HY000 (ER_VIEW_NO_INSERT_FIELD_LIST)

  Message: Can not insert into join view '%s.%s' without fields list

- Error: 1395 SQLSTATE: HY000 (ER_VIEW_DELETE_MERGE_VIEW)

  Message: Can not delete from join view '%s.%s'

- Error: 1396 SQLSTATE: HY000 (ER_CANNOT_USER)

  Message: Operation %s failed for %s

- Error: 1397 SQLSTATE: XAE04 (ER_XAER_NOTA)

  Message: XAER_NOTA: Unknown XID

- Error: 1398 SQLSTATE: XAE05 (ER_XAER_INVAL)

  Message: XAER_INVAL: Invalid arguments (or unsupported command)

- Error: 1399 SQLSTATE: XAE07 (ER_XAER_RMFAIL)

  Message: XAER_RMFAIL: The command cannot be executed when global transaction is in the %s state

- Error: 1400 SQLSTATE: XAE09 (ER_XAER_OUTSIDE)

  Message: XAER_OUTSIDE: Some work is done outside global transaction

- Error: 1401 SQLSTATE: XAE03 (ER_XAER_RMERR)

  Message: XAER_RMERR: Fatal error occurred in the transaction branch - check your data for consistency

- Error: 1402 SQLSTATE: XA100 (ER_XA_RBROLLBACK)

  Message: XA_RBROLLBACK: Transaction branch was rolled back

- Error: 1403 SQLSTATE: 42000 (ER_NONEXISTING_PROC_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on routine '%s'

- Error: 1404 SQLSTATE: HY000 (ER_PROC_AUTO_GRANT_FAIL)

  Message: Failed to grant EXECUTE and ALTER ROUTINE privileges

- Error: 1405 SQLSTATE: HY000 (ER_PROC_AUTO_REVOKE_FAIL)

  Message: Failed to revoke all privileges to dropped routine

- Error: 1406 SQLSTATE: 22001 (ER_DATA_TOO_LONG)

  Message: Data too long for column '%s' at row %ld

- Error: 1407 SQLSTATE: 42000 (ER_SP_BAD_SQLSTATE)

  Message: Bad SQLSTATE: '%s'

- Error: 1408 SQLSTATE: HY000 (ER_STARTUP)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d %s

- Error: 1409 SQLSTATE: HY000 (ER_LOAD_FROM_FIXED_SIZE_ROWS_TO_VAR)

  Message: Can't load value from file with fixed size rows to variable

- Error: 1410 SQLSTATE: 42000 (ER_CANT_CREATE_USER_WITH_GRANT)

  Message: You are not allowed to create a user with GRANT

- Error: 1411 SQLSTATE: HY000 (ER_WRONG_VALUE_FOR_TYPE)

  Message: Incorrect %s value: '%s' for function %s

- Error: 1412 SQLSTATE: HY000 (ER_TABLE_DEF_CHANGED)

  Message: Table definition has changed, please retry transaction

- Error: 1413 SQLSTATE: 42000 (ER_SP_DUP_HANDLER)

  Message: Duplicate handler declared in the same block

- Error: 1414 SQLSTATE: 42000 (ER_SP_NOT_VAR_ARG)

  Message: OUT or INOUT argument %d for routine %s is not a variable or NEW pseudo-variable in BEFORE trigger

- Error: 1415 SQLSTATE: 0A000 (ER_SP_NO_RETSET)

  Message: Not allowed to return a result set from a %s

- Error: 1416 SQLSTATE: 22003 (ER_CANT_CREATE_GEOMETRY_OBJECT)

  Message: Cannot get geometry object from data you send to the GEOMETRY field

- Error: 1418 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_ROUTINE)

  Message: This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1419 SQLSTATE: HY000 (ER_BINLOG_CREATE_ROUTINE_NEED_SUPER)

  Message: You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1421 SQLSTATE: HY000 (ER_STMT_HAS_NO_OPEN_CURSOR)

  Message: The statement (%lu) has no open cursor.

- Error: 1422 SQLSTATE: HY000 (ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG)

  Message: Explicit or implicit commit is not allowed in stored function or trigger.

- Error: 1423 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_VIEW_FIELD)

  Message: Field of view '%s.%s' underlying table doesn't have a default value

- Error: 1424 SQLSTATE: HY000 (ER_SP_NO_RECURSION)

Message: Recursive stored functions and triggers are not allowed.

- Error: 1425 SQLSTATE: 42000 (ER_TOO_BIG_SCALE)

  Message: Too big scale %d specified for column '%s'. Maximum is %lu.

- Error: 1426 SQLSTATE: 42000 (ER_TOO_BIG_PRECISION)

  Message: Too-big precision %d specified for '%s'. Maximum is %lu.

- Error: 1427 SQLSTATE: 42000 (ER_M_BIGGER_THAN_D)

  Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error: 1428 SQLSTATE: HY000 (ER_WRONG_LOCK_OF_SYSTEM_TABLE)

  Message: You can't combine write-locking of system tables with other tables or lock types

- Error: 1429 SQLSTATE: HY000 (ER_CONNECT_TO_FOREIGN_DATA_SOURCE)

  Message: Unable to connect to foreign data source: %s

- Error: 1430 SQLSTATE: HY000 (ER_QUERY_ON_FOREIGN_DATA_SOURCE)

  Message: There was a problem processing the query on the foreign data source. Data source error: %s

- Error: 1431 SQLSTATE: HY000 (ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST)

  Message: The foreign data source you are trying to reference does not exist. Data source error: %s

- Error: 1432 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE)

  Message: Can't create federated table. The data source connection string '%s' is not in the correct format

- Error: 1433 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID)

  Message: The data source connection string '%s' is not in the correct format

- Error: 1435 SQLSTATE: HY000 (ER_TRG_IN_WRONG_SCHEMA)

  Message: Trigger in wrong schema

- Error: 1436 SQLSTATE: HY000 (ER_STACK_OVERRUN_NEED_MORE)

  Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld --thread_stack=#' to specify a bigger stack.

- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)

  Message: Routine body for '%s' is too long

- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)

  Message: Cannot drop default keycache

- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)

  Message: Display width out of range for column '%s' (max = %lu)

- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)

  Message: XAER_DUPID: The XID already exists

- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)

  Message: Datetime function: %s field overflow

- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)

  Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)

  Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)

  Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)

  Message: Not allowed to set autocommit from a stored function or trigger

- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)

  Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)

  Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)

  Message: The user specified as a definer ('%s'@'%s') does not exist

- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)

  Message: Changing schema from '%s' to '%s' is not allowed.

- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)

  Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)

  Message: Cannot add or update a child row: a foreign key constraint fails (%s)

- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)

  Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 (ER_TRG_NO_DEFINER)

  Message: No definer attribute for trigger '%s'.'%s'. It's disallowed to create trigger without definer.

- Error: 1455 SQLSTATE: HY000 (ER_OLD_FILE_FORMAT)

  Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error: 1456 SQLSTATE: HY000 (ER_SP_RECURSION_LIMIT)

  Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error: 1458 SQLSTATE: 42000 (ER_SP_WRONG_NAME)

  Message: Incorrect routine name '%s'
- Error: 1459 SQLSTATE: HY000 (ER_TABLE_NEEDS_UPGRADE)

  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!
- Error: 1460 SQLSTATE: 42000 (ER_SP_NO_AGGREGATE)

  Message: AGGREGATE is not supported for stored functions
- Error: 1461 SQLSTATE: 42000 (ER_MAX_PREPARED_STMT_COUNT_REACHED)

  Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)
- Error: 1462 SQLSTATE: HY000 (ER_VIEW_RECURSIVE)

  Message: `%s`.`%s` contains view recursion
- Error: 1463 SQLSTATE: 42000 (ER_NON_GROUPING_FIELD_USED)

  Message: Non-grouping field '%s' is used in %s clause
- Error: 1464 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_SPKEYS)

  Message: The used table type doesn't support SPATIAL indexes
- Error: 1465 SQLSTATE: HY000 (ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA)

  Message: Triggers can not be created on system tables
- Error: 1466 SQLSTATE: HY000 (ER_REMOVED_SPACES)

  Message: Leading spaces are removed from name '%s'
- Error: 1467 SQLSTATE: HY000 (ER_AUTOINC_READ_FAILED)

  Message: Failed to read auto-increment value from storage engine
- Error: 1468 SQLSTATE: HY000 (ER_USERNAME)

  Message: user name
- Error: 1469 SQLSTATE: HY000 (ER_HOSTNAME)

  Message: host name
- Error: 1470 SQLSTATE: HY000 (ER_WRONG_STRING_LENGTH)

  Message: String '%s' is too long for %s (should be no longer than %d)
- Error: 1471 SQLSTATE: HY000 (ER_NON_INSERTABLE_TABLE)

  Message: The target table %s of the %s is not insertable-into
- Error: 1472 SQLSTATE: HY000 (ER_ADMIN_WRONG_MRG_TABLE)

  Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist
- Error: 1473 SQLSTATE: HY000 (ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT)

  Message: Too high level of nesting for select
- Error: 1474 SQLSTATE: HY000 (ER_NAME_BECOMES_EMPTY)

Message: Name '%s' has become ''

- Error: 1475 SQLSTATE: HY000 (ER_AMBIGUOUS_FIELD_TERM)

  Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- Error: 1476 SQLSTATE: HY000 (ER_FOREIGN_SERVER_EXISTS)

  Message: The foreign server, %s, you are trying to create already exists.

- Error: 1477 SQLSTATE: HY000 (ER_FOREIGN_SERVER_DOESNT_EXIST)

  Message: The foreign server name you are trying to reference does not exist. Data source error: %s

- Error: 1478 SQLSTATE: HY000 (ER_ILLEGAL_HA_CREATE_OPTION)

  Message: Table storage engine '%s' does not support the create option '%s'

- Error: 1479 SQLSTATE: HY000 (ER_PARTITION_REQUIRES_VALUES_ERROR)

  Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition

- Error: 1480 SQLSTATE: HY000 (ER_PARTITION_WRONG_VALUES_ERROR)

  Message: Only %s PARTITIONING can use VALUES %s in partition definition

- Error: 1481 SQLSTATE: HY000 (ER_PARTITION_MAXVALUE_ERROR)

  Message: MAXVALUE can only be used in last partition definition

- Error: 1484 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_PART_ERROR)

  Message: Wrong number of partitions defined, mismatch with previous setting

- Error: 1485 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_SUBPART_ERROR)

  Message: Wrong number of subpartitions defined, mismatch with previous setting

- Error: 1486 SQLSTATE: HY000 (ER_WRONG_EXPR_IN_PARTITION_FUNC_ERROR)

  Message: Constant, random or timezone-dependent expressions in (sub)partitioning function are not allowed

- Error: 1488 SQLSTATE: HY000 (ER_FIELD_NOT_FOUND_PART_ERROR)

  Message: Field in list of fields for partition function not found in table

- Error: 1490 SQLSTATE: HY000 (ER_INCONSISTENT_PARTITION_INFO_ERROR)

  Message: The partition info in the frm file is not consistent with what can be written into the frm file

- Error: 1491 SQLSTATE: HY000 (ER_PARTITION_FUNC_NOT_ALLOWED_ERROR)

  Message: The %s function returns the wrong type

- Error: 1492 SQLSTATE: HY000 (ER_PARTITIONS_MUST_BE_DEFINED_ERROR)

  Message: For %s partitions each partition must be defined

- Error: 1493 SQLSTATE: HY000 (ER_RANGE_NOT_INCREASING_ERROR)

  Message: VALUES LESS THAN value must be strictly increasing for each partition

- Error: 1494 SQLSTATE: HY000 (ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR)

  Message: VALUES value must be of same type as partition function

- Error: 1495 SQLSTATE: HY000 (ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR)

  Message: Multiple definition of same constant in list partitioning

- Error: 1496 SQLSTATE: HY000 (ER_PARTITION_ENTRY_ERROR)

  Message: Partitioning can not be used stand-alone in query

- Error: 1497 SQLSTATE: HY000 (ER_MIX_HANDLER_ERROR)

  Message: The mix of handlers in the partitions is not allowed in this version of MySQL

- Error: 1498 SQLSTATE: HY000 (ER_PARTITION_NOT_DEFINED_ERROR)

  Message: For the partitioned engine it is necessary to define all %s

- Error: 1499 SQLSTATE: HY000 (ER_TOO_MANY_PARTITIONS_ERROR)

  Message: Too many partitions (including subpartitions) were defined

- Error: 1500 SQLSTATE: HY000 (ER_SUBPARTITION_ERROR)

  Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning

- Error: 1501 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_FILE)

  Message: Failed to create specific handler file

- Error: 1502 SQLSTATE: HY000 (ER_BLOB_FIELD_IN_PART_FUNC_ERROR)

  Message: A BLOB field is not allowed in partition function

- Error: 1503 SQLSTATE: HY000 (ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF)

  Message: A %s must include all columns in the table's partitioning function

- Error: 1504 SQLSTATE: HY000 (ER_NO_PARTS_ERROR)

  Message: Number of %s = 0 is not an allowed value

- Error: 1505 SQLSTATE: HY000 (ER_PARTITION_MGMT_ON_NONPARTITIONED)

  Message: Partition management on a not partitioned table is not possible

- Error: 1506 SQLSTATE: HY000 (ER_FOREIGN_KEY_ON_PARTITIONED)

  Message: Foreign keys are not yet supported in conjunction with partitioning

- Error: 1507 SQLSTATE: HY000 (ER_DROP_PARTITION_NON_EXISTENT)

  Message: Error in list of partitions to %s

- Error: 1508 SQLSTATE: HY000 (ER_DROP_LAST_PARTITION)

  Message: Cannot remove all partitions, use DROP TABLE instead

- Error: 1509 SQLSTATE: HY000 (ER_COALESCE_ONLY_ON_HASH_PARTITION)

  Message: COALESCE PARTITION can only be used on HASH/KEY partitions

- Error: 1510 SQLSTATE: HY000 (ER_REORG_HASH_ONLY_ON_SAME_NO)

  Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers

- Error: 1511 SQLSTATE: HY000 (ER_REORG_NO_PARAM_ERROR)

  Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs

- Error: 1512 SQLSTATE: HY000 (ER_ONLY_ON_RANGE_LIST_PARTITION)

  Message: %s PARTITION can only be used on RANGE/LIST partitions

- Error: 1513 SQLSTATE: HY000 (ER_ADD_PARTITION_SUBPART_ERROR)

  Message: Trying to Add partition(s) with wrong number of subpartitions

- Error: 1514 SQLSTATE: HY000 (ER_ADD_PARTITION_NO_NEW_PARTITION)

  Message: At least one partition must be added

- Error: 1515 SQLSTATE: HY000 (ER_COALESCE_PARTITION_NO_PARTITION)

  Message: At least one partition must be coalesced

- Error: 1516 SQLSTATE: HY000 (ER_REORG_PARTITION_NOT_EXIST)

  Message: More partitions to reorganize than there are partitions

- Error: 1517 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION)

  Message: Duplicate partition name %s

- Error: 1518 SQLSTATE: HY000 (ER_NO_BINLOG_ERROR)

  Message: It is not allowed to shut off binlog on this command

- Error: 1519 SQLSTATE: HY000 (ER_CONSECUTIVE_REORG_PARTITIONS)

  Message: When reorganizing a set of partitions they must be in consecutive order

- Error: 1520 SQLSTATE: HY000 (ER_REORG_OUTSIDE_RANGE)

  Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1521 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_FAILURE)

  Message: Partition function not supported in this version for this handler

- Error: 1523 SQLSTATE: HY000 (ER_LIMITED_PART_RANGE)

  Message: The %s handler only supports 32 bit integers in VALUES

- Error: 1524 SQLSTATE: HY000 (ER_PLUGIN_IS_NOT_LOADED)

  Message: Plugin '%s' is not loaded

- Error: 1525 SQLSTATE: HY000 (ER_WRONG_VALUE)

  Message: Incorrect %s value: '%s'

- Error: 1526 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE)

Message: Table has no partition for value %s

- Error: 1527 SQLSTATE: HY000 (ER_FILEGROUP_OPTION_ONLY_ONCE)

  Message: It is not allowed to specify %s more than once

- Error: 1528 SQLSTATE: HY000 (ER_CREATE_FILEGROUP_FAILED)

  Message: Failed to create %s

- Error: 1529 SQLSTATE: HY000 (ER_DROP_FILEGROUP_FAILED)

  Message: Failed to drop %s

- Error: 1530 SQLSTATE: HY000 (ER_TABLESPACE_AUTO_EXTEND_ERROR)

  Message: The handler doesn't support autoextend of tablespaces

- Error: 1531 SQLSTATE: HY000 (ER_WRONG_SIZE_NUMBER)

  Message: A size parameter was incorrectly specified, either number or on the form 10M

- Error: 1532 SQLSTATE: HY000 (ER_SIZE_OVERFLOW_ERROR)

  Message: The size number was correct but we don't allow the digit part to be more than 2 billion

- Error: 1533 SQLSTATE: HY000 (ER_ALTER_FILEGROUP_FAILED)

  Message: Failed to alter: %s

- Error: 1534 SQLSTATE: HY000 (ER_BINLOG_ROW_LOGGING_FAILED)

  Message: Writing one row to the row-based binary log failed

- Error: 1537 SQLSTATE: HY000 (ER_EVENT_ALREADY_EXISTS)

  Message: Event '%s' already exists

- Error: 1539 SQLSTATE: HY000 (ER_EVENT_DOES_NOT_EXIST)

  Message: Unknown event '%s'

- Error: 1542 SQLSTATE: HY000 (ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG)

  Message: INTERVAL is either not positive or too big

- Error: 1543 SQLSTATE: HY000 (ER_EVENT_ENDS_BEFORE_STARTS)

  Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 (ER_EVENT_EXEC_TIME_IN_THE_PAST)

  Message: Event execution time is in the past. Event has been disabled

- Error: 1551 SQLSTATE: HY000 (ER_EVENT_SAME_NAME)

  Message: Same old and new event name

- Error: 1553 SQLSTATE: HY000 (ER_DROP_INDEX_FK)

  Message: Cannot drop index '%s': needed in a foreign key constraint

  InnoDB reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

For optimal performance with DML statements, InnoDB requires an index to exist on foreign key columns, so that UPDATE and DELETE operations on a parent table can easily check whether corresponding rows exist in the child table. MySQL creates or drops such indexes automatically when needed, as a side-effect of CREATE TABLE, CREATE INDEX, and ALTER TABLE statements.

When you drop an index, InnoDB checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. InnoDB prevents you from dropping the last index that can enforce a particular referential constraint.

- Error: 1554 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_WITH_VER)

  Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

- Error: 1556 SQLSTATE: HY000 (ER_CANT_LOCK_LOG_TABLE)

  Message: You can't use locks with log tables.

- Error: 1557 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY_OLD_UNUSED)

  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- Error: 1558 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- Error: 1559 SQLSTATE: HY000 (ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR)

  Message: Cannot switch out of the row-based binary log format when the session has open temporary tables

- Error: 1560 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot change the binary logging format inside a stored function or trigger

- Error: 1562 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)

  Message: Cannot create temporary table with partitions

- Error: 1563 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)

  Message: Partition constant is out of partition function domain

- Error: 1564 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)

  Message: This partition function is not allowed

- Error: 1565 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)

  Message: Error in DDL log

  ER_DDL_LOG_ERROR was removed after 8.0.1.

- Error: 1566 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)

  Message: Not allowed to use NULL value in VALUES LESS THAN

- Error: 1567 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)

  Message: Incorrect partition name

- Error: 1568 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_CHARACTERISTICS)

Message: Transaction characteristics can't be changed while a transaction is in progress

- Error: 1569 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)

  Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'

- Error: 1571 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)

  Message: Error during starting/stopping of the scheduler. Error code %u

- Error: 1572 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)

  Message: Engine cannot be used in partitioned tables

- Error: 1575 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)

  Message: Decoding of base64 string failed

- Error: 1576 SQLSTATE: HY000 (ER_EVENT_RECURSION_FORBIDDEN)

  Message: Recursion of EVENT DDL statements is forbidden when body is present

- Error: 1578 SQLSTATE: HY000 (ER_ONLY_INTEGERS_ALLOWED)

  Message: Only integers allowed as number here

- Error: 1579 SQLSTATE: HY000 (ER_UNSUPORTED_LOG_ENGINE)

  Message: This storage engine cannot be used for log tables

- Error: 1580 SQLSTATE: HY000 (ER_BAD_LOG_STATEMENT)

  Message: You cannot '%s' a log table if logging is enabled

- Error: 1581 SQLSTATE: HY000 (ER_CANT_RENAME_LOG_TABLE)

  Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error: 1582 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_NATIVE_FCT)

  Message: Incorrect parameter count in the call to native function '%s'

- Error: 1583 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_NATIVE_FCT)

  Message: Incorrect parameters in the call to native function '%s'

- Error: 1584 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_STORED_FCT)

  Message: Incorrect parameters in the call to stored function %s

- Error: 1585 SQLSTATE: HY000 (ER_NATIVE_FCT_NAME_COLLISION)

  Message: This function '%s' has the same name as a native function

- Error: 1586 SQLSTATE: 23000 (ER_DUP_ENTRY_WITH_KEY_NAME)

  Message: Duplicate entry '%s' for key '%s'

  The format string for this error is also used with ER_DUP_ENTRY.

- Error: 1587 SQLSTATE: HY000 (ER_BINLOG_PURGE_EMFILE)

Message: Too many files opened, please execute the command again

- Error: 1588 SQLSTATE: HY000 (ER_EVENT_CANNOT_CREATE_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1589 SQLSTATE: HY000 (ER_EVENT_CANNOT_ALTER_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was not changed. Specify a time in the future.

- Error: 1590 SQLSTATE: HY000 (ER_SLAVE_INCIDENT)

  Message: The incident %s occured on the master. Message: %s

- Error: 1591 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE_SILENT)

  Message: Table has no partition for some existing values

- Error: 1592 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_STATEMENT)

  Message: Unsafe statement written to the binary log using statement format since BINLOG_FORMAT = STATEMENT. %s

- Error: 1593 SQLSTATE: HY000 (ER_SLAVE_FATAL_ERROR)

  Message: Fatal error: %s

- Error: 1594 SQLSTATE: HY000 (ER_SLAVE_RELAY_LOG_READ_FAILURE)

  Message: Relay log read failure: %s

- Error: 1595 SQLSTATE: HY000 (ER_SLAVE_RELAY_LOG_WRITE_FAILURE)

  Message: Relay log write failure: %s

- Error: 1596 SQLSTATE: HY000 (ER_SLAVE_CREATE_EVENT_FAILURE)

  Message: Failed to create %s

- Error: 1597 SQLSTATE: HY000 (ER_SLAVE_MASTER_COM_FAILURE)

  Message: Master command %s failed: %s

- Error: 1598 SQLSTATE: HY000 (ER_BINLOG_LOGGING_IMPOSSIBLE)

  Message: Binary logging not possible. Message: %s

- Error: 1599 SQLSTATE: HY000 (ER_VIEW_NO_CREATION_CTX)

  Message: View `%s`.`%s` has no creation context

- Error: 1600 SQLSTATE: HY000 (ER_VIEW_INVALID_CREATION_CTX)

  Message: Creation context of view `%s`.`%s' is invalid

- Error: 1602 SQLSTATE: HY000 (ER_TRG_CORRUPTED_FILE)

  Message: Corrupted TRG file for table `%s`.`%s`

- Error: 1603 SQLSTATE: HY000 (ER_TRG_NO_CREATION_CTX)

  Message: Triggers for table `%s`.`%s` have no creation context

- Error: 1604 SQLSTATE: HY000 (ER_TRG_INVALID_CREATION_CTX)

  Message: Trigger creation context of table `%s`.`%s` is invalid

- Error: 1605 SQLSTATE: HY000 (ER_EVENT_INVALID_CREATION_CTX)

  Message: Creation context of event `%s`.`%s` is invalid

- Error: 1606 SQLSTATE: HY000 (ER_TRG_CANT_OPEN_TABLE)

  Message: Cannot open table for trigger `%s`.`%s`

- Error: 1609 SQLSTATE: HY000 (ER_NO_FORMAT_DESCRIPTION_EVENT_BEFORE_BINLOG_STATEMENT)

  Message: The BINLOG statement of type `%s` was not preceded by a format description BINLOG statement.

- Error: 1610 SQLSTATE: HY000 (ER_SLAVE_CORRUPT_EVENT)

  Message: Corrupted replication event was detected

- Error: 1612 SQLSTATE: HY000 (ER_LOG_PURGE_NO_FILE)

  Message: Being purged log %s was not found

- Error: 1613 SQLSTATE: XA106 (ER_XA_RBTIMEOUT)

  Message: XA_RBTIMEOUT: Transaction branch was rolled back: took too long

- Error: 1614 SQLSTATE: XA102 (ER_XA_RBDEADLOCK)

  Message: XA_RBDEADLOCK: Transaction branch was rolled back: deadlock was detected

- Error: 1615 SQLSTATE: HY000 (ER_NEED_REPREPARE)

  Message: Prepared statement needs to be re-prepared

- Error: 1617 SQLSTATE: HY000 (WARN_NO_MASTER_INFO)

  Message: The master info structure does not exist

- Error: 1618 SQLSTATE: HY000 (WARN_OPTION_IGNORED)

  Message: <%s> option ignored

- Error: 1619 SQLSTATE: HY000 (ER_PLUGIN_DELETE_BUILTIN)

  Message: Built-in plugins cannot be deleted

- Error: 1620 SQLSTATE: HY000 (WARN_PLUGIN_BUSY)

  Message: Plugin is busy and will be uninstalled on shutdown

- Error: 1621 SQLSTATE: HY000 (ER_VARIABLE_IS_READONLY)

  Message: %s variable '%s' is read-only. Use SET %s to assign the value

- Error: 1622 SQLSTATE: HY000 (ER_WARN_ENGINE_TRANSACTION_ROLLBACK)

  Message: Storage engine %s does not support rollback for this statement. Transaction rolled back and must be restarted

- Error: 1623 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_FAILURE)

Message: Unexpected master's heartbeat data: %s

- Error: 1624 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE)

  Message: The requested value for the heartbeat period is either negative or exceeds the maximum allowed (%s seconds).

- Error: 1625 SQLSTATE: HY000 (ER_NDB_REPLICATION_SCHEMA_ERROR)

  Message: Bad schema for mysql.ndb_replication table. Message: %s

- Error: 1626 SQLSTATE: HY000 (ER_CONFLICT_FN_PARSE_ERROR)

  Message: Error in parsing conflict function. Message: %s

- Error: 1627 SQLSTATE: HY000 (ER_EXCEPTIONS_WRITE_ERROR)

  Message: Write to exceptions table failed. Message: %s

- Error: 1628 SQLSTATE: HY000 (ER_TOO_LONG_TABLE_COMMENT)

  Message: Comment for table '%s' is too long (max = %lu)

- Error: 1629 SQLSTATE: HY000 (ER_TOO_LONG_FIELD_COMMENT)

  Message: Comment for field '%s' is too long (max = %lu)

- Error: 1630 SQLSTATE: 42000 (ER_FUNC_INEXISTENT_NAME_COLLISION)

  Message: FUNCTION %s does not exist. Check the 'Function Name Parsing and Resolution' section in the Reference Manual

- Error: 1631 SQLSTATE: HY000 (ER_DATABASE_NAME)

  Message: Database

- Error: 1632 SQLSTATE: HY000 (ER_TABLE_NAME)

  Message: Table

- Error: 1633 SQLSTATE: HY000 (ER_PARTITION_NAME)

  Message: Partition

- Error: 1634 SQLSTATE: HY000 (ER_SUBPARTITION_NAME)

  Message: Subpartition

- Error: 1635 SQLSTATE: HY000 (ER_TEMPORARY_NAME)

  Message: Temporary

- Error: 1636 SQLSTATE: HY000 (ER_RENAMED_NAME)

  Message: Renamed

- Error: 1637 SQLSTATE: HY000 (ER_TOO_MANY_CONCURRENT_TRXS)

  Message: Too many active concurrent transactions

- Error: 1638 SQLSTATE: HY000 (WARN_NON_ASCII_SEPARATOR_NOT_IMPLEMENTED)

  Message: Non-ASCII separator arguments are not fully supported

- Error: 1639 SQLSTATE: HY000 (ER_DEBUG_SYNC_TIMEOUT)

  Message: debug sync point wait timed out

- Error: 1640 SQLSTATE: HY000 (ER_DEBUG_SYNC_HIT_LIMIT)

  Message: debug sync point hit limit reached

- Error: 1641 SQLSTATE: 42000 (ER_DUP_SIGNAL_SET)

  Message: Duplicate condition information item '%s'

- Error: 1642 SQLSTATE: 01000 (ER_SIGNAL_WARN)

  Message: Unhandled user-defined warning condition

- Error: 1643 SQLSTATE: 02000 (ER_SIGNAL_NOT_FOUND)

  Message: Unhandled user-defined not found condition

- Error: 1644 SQLSTATE: HY000 (ER_SIGNAL_EXCEPTION)

  Message: Unhandled user-defined exception condition

- Error: 1645 SQLSTATE: 0K000 (ER_RESIGNAL_WITHOUT_ACTIVE_HANDLER)

  Message: RESIGNAL when handler not active

- Error: 1646 SQLSTATE: HY000 (ER_SIGNAL_BAD_CONDITION_TYPE)

  Message: SIGNAL/RESIGNAL can only use a CONDITION defined with SQLSTATE

- Error: 1647 SQLSTATE: HY000 (WARN_COND_ITEM_TRUNCATED)

  Message: Data truncated for condition item '%s'

- Error: 1648 SQLSTATE: HY000 (ER_COND_ITEM_TOO_LONG)

  Message: Data too long for condition item '%s'

- Error: 1649 SQLSTATE: HY000 (ER_UNKNOWN_LOCALE)

  Message: Unknown locale: '%s'

- Error: 1650 SQLSTATE: HY000 (ER_SLAVE_IGNORE_SERVER_IDS)

  Message: The requested server id %d clashes with the slave startup option --replicate-same-server-id

- Error: 1651 SQLSTATE: HY000 (ER_QUERY_CACHE_DISABLED)

  Message: Query cache is disabled; restart the server with query_cache_type=1 to enable it

  ER_QUERY_CACHE_DISABLED was removed after 8.0.2.

- Error: 1652 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION_FIELD)

  Message: Duplicate partition field name '%s'

- Error: 1653 SQLSTATE: HY000 (ER_PARTITION_COLUMN_LIST_ERROR)

  Message: Inconsistency in usage of column lists for partitioning

- Error: 1654 SQLSTATE: HY000 (ER_WRONG_TYPE_COLUMN_VALUE_ERROR)

Message: Partition column values of incorrect type

- Error: 1655 SQLSTATE: HY000 (ER_TOO_MANY_PARTITION_FUNC_FIELDS_ERROR)

  Message: Too many fields in '%s'

- Error: 1656 SQLSTATE: HY000 (ER_MAXVALUE_IN_VALUES_IN)

  Message: Cannot use MAXVALUE as value in VALUES IN

- Error: 1657 SQLSTATE: HY000 (ER_TOO_MANY_VALUES_ERROR)

  Message: Cannot have more than one value for this type of %s partitioning

- Error: 1658 SQLSTATE: HY000 (ER_ROW_SINGLE_PARTITION_FIELD_ERROR)

  Message: Row expressions in VALUES IN only allowed for multi-field column partitioning

- Error: 1659 SQLSTATE: HY000 (ER_FIELD_TYPE_NOT_ALLOWED_AS_PARTITION_FIELD)

  Message: Field '%s' is of a not allowed type for this type of partitioning

- Error: 1660 SQLSTATE: HY000 (ER_PARTITION_FIELDS_TOO_LONG)

  Message: The total length of the partitioning fields is too large

- Error: 1661 SQLSTATE: HY000 (ER_BINLOG_ROW_ENGINE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.

- Error: 1662 SQLSTATE: HY000 (ER_BINLOG_ROW_MODE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.

- Error: 1663 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s

- Error: 1664 SQLSTATE: HY000 (ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.

- Error: 1665 SQLSTATE: HY000 (ER_BINLOG_STMT_MODE_AND_ROW_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s

- Error: 1666 SQLSTATE: HY000 (ER_BINLOG_ROW_INJECTION_AND_STMT_MODE)

  Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.

- Error: 1667 SQLSTATE: HY000 (ER_BINLOG_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE)

  Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.

- Error: 1668 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_LIMIT)

Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.

- Error: 1670 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_TABLE)

  Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.

- Error: 1671 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_AUTOINC_COLUMNS)

  Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.

- Error: 1672 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_UDF)

  Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

- Error: 1673 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_VARIABLE)

  Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

- Error: 1674 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SYSTEM_FUNCTION)

  Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

- Error: 1675 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_NONTRANS_AFTER_TRANS)

  Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

- Error: 1676 SQLSTATE: HY000 (ER_MESSAGE_AND_STATEMENT)

  Message: %s Statement: %s

- Error: 1677 SQLSTATE: HY000 (ER_SLAVE_CONVERSION_FAILED)

  Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'

- Error: 1678 SQLSTATE: HY000 (ER_SLAVE_CANT_CREATE_CONVERSION)

  Message: Can't create conversion table for table '%s.%s'

- Error: 1679 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot modify @@session.binlog_format inside a transaction

- Error: 1680 SQLSTATE: HY000 (ER_PATH_LENGTH)

  Message: The path specified for %s is too long.

- Error: 1681 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_NO_REPLACEMENT)

  Message: '%s' is deprecated and will be removed in a future release.

- Error: 1682 SQLSTATE: HY000 (ER_WRONG_NATIVE_TABLE_STRUCTURE)

  Message: Native table '%s'.'%s' has the wrong structure

- Error: 1683 SQLSTATE: HY000 (ER_WRONG_PERFSCHEMA_USAGE)

Message: Invalid performance_schema usage.

- Error: 1684 SQLSTATE: HY000 (ER_WARN_I_S_SKIPPED_TABLE)

  Message: Table '%s'.'%s' was skipped since its definition is being modified by concurrent DDL statement

- Error: 1685 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_DIRECT)

  Message: Cannot modify @@session.binlog_direct_non_transactional_updates inside a transaction

- Error: 1686 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_DIRECT)

  Message: Cannot change the binlog direct flag inside a stored function or trigger

- Error: 1687 SQLSTATE: 42000 (ER_SPATIAL_MUST_HAVE_GEOM_COL)

  Message: A SPATIAL index may only contain a geometrical type column

- Error: 1688 SQLSTATE: HY000 (ER_TOO_LONG_INDEX_COMMENT)

  Message: Comment for index '%s' is too long (max = %lu)

- Error: 1689 SQLSTATE: HY000 (ER_LOCK_ABORTED)

  Message: Wait on a lock was aborted due to a pending exclusive lock

- Error: 1690 SQLSTATE: 22003 (ER_DATA_OUT_OF_RANGE)

  Message: %s value is out of range in '%s'

- Error: 1691 SQLSTATE: HY000 (ER_WRONG_SPVAR_TYPE_IN_LIMIT)

  Message: A variable of a non-integer based type in LIMIT clause

- Error: 1692 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE)

  Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.

- Error: 1693 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_MIXED_STATEMENT)

  Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.

- Error: 1694 SQLSTATE: HY000 (ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SQL_LOG_BIN)

  Message: Cannot modify @@session.sql_log_bin inside a transaction

- Error: 1695 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_SQL_LOG_BIN)

  Message: Cannot change the sql_log_bin inside a stored function or trigger

- Error: 1696 SQLSTATE: HY000 (ER_FAILED_READ_FROM_PAR_FILE)

  Message: Failed to read from the .par file

- Error: 1697 SQLSTATE: HY000 (ER_VALUES_IS_NOT_INT_TYPE_ERROR)

  Message: VALUES value for partition '%s' must have type INT

- Error: 1698 SQLSTATE: 28000 (ER_ACCESS_DENIED_NO_PASSWORD_ERROR)

  Message: Access denied for user '%s'@'%s'

- Error: 1699 SQLSTATE: HY000 (ER_SET_PASSWORD_AUTH_PLUGIN)

  Message: SET PASSWORD has no significance for users authenticating via plugins

- Error: 1701 SQLSTATE: 42000 (ER_TRUNCATE_ILLEGAL_FK)

  Message: Cannot truncate a table referenced in a foreign key constraint (%s)

- Error: 1702 SQLSTATE: HY000 (ER_PLUGIN_IS_PERMANENT)

  Message: Plugin '%s' is force_plus_permanent and can not be unloaded

- Error: 1703 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MIN)

  Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.

- Error: 1704 SQLSTATE: HY000 (ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX)

  Message: The requested value for the heartbeat period exceeds the value of `slave_net_timeout' seconds. A sensible value for the period should be less than the timeout.

- Error: 1705 SQLSTATE: HY000 (ER_STMT_CACHE_FULL)

  Message: Multi-row statements required more than 'max_binlog_stmt_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1706 SQLSTATE: HY000 (ER_MULTI_UPDATE_KEY_CONFLICT)

  Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%s'.

- Error: 1707 SQLSTATE: HY000 (ER_TABLE_NEEDS_REBUILD)

  Message: Table rebuild required. Please do "ALTER TABLE `%s` FORCE" or dump/reload to fix it!

- Error: 1708 SQLSTATE: HY000 (WARN_OPTION_BELOW_LIMIT)

  Message: The value of '%s' should be no less than the value of '%s'

- Error: 1709 SQLSTATE: HY000 (ER_INDEX_COLUMN_TOO_LONG)

  Message: Index column size too large. The maximum column size is %lu bytes.

- Error: 1710 SQLSTATE: HY000 (ER_ERROR_IN_TRIGGER_BODY)

  Message: Trigger '%s' has an error in its body: '%s'

- Error: 1711 SQLSTATE: HY000 (ER_ERROR_IN_UNKNOWN_TRIGGER_BODY)

  Message: Unknown trigger has an error in its body: '%s'

- Error: 1712 SQLSTATE: HY000 (ER_INDEX_CORRUPT)

  Message: Index %s is corrupted

- Error: 1713 SQLSTATE: HY000 (ER_UNDO_RECORD_TOO_BIG)

  Message: Undo log record is too big.

- Error: 1714 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT)

  Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1715 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE)

  Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.

- Error: 1716 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_REPLACE_SELECT)

  Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1717 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT)

  Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1718 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT)

  Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1719 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_UPDATE_IGNORE)

  Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1720 SQLSTATE: HY000 (ER_PLUGIN_NO_UNINSTALL)

  Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

- Error: 1721 SQLSTATE: HY000 (ER_PLUGIN_NO_INSTALL)

  Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error: 1722 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_WRITE_AUTOINC_SELECT)

  Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

- Error: 1723 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_CREATE_SELECT_AUTOINC)

  Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

- Error: 1724 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_INSERT_TWO_KEYS)

  Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe

- Error: 1725 SQLSTATE: HY000 (ER_TABLE_IN_FK_CHECK)

  Message: Table is being used in foreign key check.

- Error: 1726 SQLSTATE: HY000 (ER_UNSUPPORTED_ENGINE)

  Message: Storage engine '%s' does not support system tables. [%s.%s]

- Error: 1727 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_AUTOINC_NOT_FIRST)

  Message: INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.

- Error: 1728 SQLSTATE: HY000 (ER_CANNOT_LOAD_FROM_TABLE_V2)

  Message: Cannot load from %s.%s. The table is probably corrupted

- Error: 1729 SQLSTATE: HY000 (ER_MASTER_DELAY_VALUE_OUT_OF_RANGE)

  Message: The requested value %s for the master delay exceeds the maximum %u

- Error: 1730 SQLSTATE: HY000 (ER_ONLY_FD_AND_RBR_EVENTS_ALLOWED_IN_BINLOG_STATEMENT)

  Message: Only Format_description_log_event and row events are allowed in BINLOG statements (but %s was provided)

- Error: 1731 SQLSTATE: HY000 (ER_PARTITION_EXCHANGE_DIFFERENT_OPTION)

  Message: Non matching attribute '%s' between partition and table

- Error: 1732 SQLSTATE: HY000 (ER_PARTITION_EXCHANGE_PART_TABLE)

  Message: Table to exchange with partition is partitioned: '%s'

- Error: 1733 SQLSTATE: HY000 (ER_PARTITION_EXCHANGE_TEMP_TABLE)

  Message: Table to exchange with partition is temporary: '%s'

- Error: 1734 SQLSTATE: HY000 (ER_PARTITION_INSTEAD_OF_SUBPARTITION)

  Message: Subpartitioned table, use subpartition instead of partition

- Error: 1735 SQLSTATE: HY000 (ER_UNKNOWN_PARTITION)

  Message: Unknown partition '%s' in table '%s'

- Error: 1736 SQLSTATE: HY000 (ER_TABLES_DIFFERENT_METADATA)

  Message: Tables have different definitions

- Error: 1737 SQLSTATE: HY000 (ER_ROW_DOES_NOT_MATCH_PARTITION)

  Message: Found a row that does not match the partition

- Error: 1738 SQLSTATE: HY000 (ER_BINLOG_CACHE_SIZE_GREATER_THAN_MAX)

  Message: Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.

- Error: 1739 SQLSTATE: HY000 (ER_WARN_INDEX_NOT_APPLICABLE)

  Message: Cannot use %s access on index '%s' due to type or collation conversion on field '%s'

- Error: 1740 SQLSTATE: HY000 (ER_PARTITION_EXCHANGE_FOREIGN_KEY)

Message: Table to exchange with partition has foreign key references: '%s'

- Error: 1742 SQLSTATE: HY000 (ER_RPL_INFO_DATA_TOO_LONG)

  Message: Data for column '%s' too long

- Error: 1743 SQLSTATE: HY000 (ER_NETWORK_READ_EVENT_CHECKSUM_FAILURE)

  Message: Replication event checksum verification failed while reading from network.

- Error: 1745 SQLSTATE: HY000 (ER_BINLOG_STMT_CACHE_SIZE_GREATER_THAN_MAX)

  Message: Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); setting binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.

- Error: 1746 SQLSTATE: HY000 (ER_CANT_UPDATE_TABLE_IN_CREATE_TABLE_SELECT)

  Message: Can't update table '%s' while '%s' is being created.

- Error: 1747 SQLSTATE: HY000 (ER_PARTITION_CLAUSE_ON_NONPARTITIONED)

  Message: PARTITION () clause on non partitioned table

- Error: 1748 SQLSTATE: HY000 (ER_ROW_DOES_NOT_MATCH_GIVEN_PARTITION_SET)

  Message: Found a row not matching the given partition set

- Error: 1750 SQLSTATE: HY000 (ER_CHANGE_RPL_INFO_REPOSITORY_FAILURE)

  Message: Failure while changing the type of replication repository: %s.

- Error: 1751 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_CREATED_TEMP_TABLE)

  Message: The creation of some temporary tables could not be rolled back.

- Error: 1752 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_DROPPED_TEMP_TABLE)

  Message: Some temporary tables were dropped, but these operations could not be rolled back.

- Error: 1753 SQLSTATE: HY000 (ER_MTS_FEATURE_IS_NOT_SUPPORTED)

  Message: %s is not supported in multi-threaded slave mode. %s

- Error: 1754 SQLSTATE: HY000 (ER_MTS_UPDATED_DBS_GREATER_MAX)

  Message: The number of modified databases exceeds the maximum %d; the database names will not be included in the replication event metadata.

- Error: 1755 SQLSTATE: HY000 (ER_MTS_CANT_PARALLEL)

  Message: Cannot execute the current event group in the parallel mode. Encountered event %s, relay-log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s.

- Error: 1756 SQLSTATE: HY000 (ER_MTS_INCONSISTENT_DATA)

  Message: %s

- Error: 1757 SQLSTATE: HY000 (ER_FULLTEXT_NOT_SUPPORTED_WITH_PARTITIONING)

  Message: FULLTEXT index is not supported for partitioned tables.

- Error: 1758 SQLSTATE: 35000 (ER_DA_INVALID_CONDITION_NUMBER)

  Message: Invalid condition number

- Error: 1759 SQLSTATE: HY000 (ER_INSECURE_PLAIN_TEXT)

  Message: Sending passwords in plain text without SSL/TLS is extremely insecure.

- Error: 1760 SQLSTATE: HY000 (ER_INSECURE_CHANGE_MASTER)

  Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the 'START SLAVE Syntax' in the MySQL Manual for more information.

- Error: 1761 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY_WITH_CHILD_INFO)

  Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in table '%s', key '%s'

- Error: 1762 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY_WITHOUT_CHILD_INFO)

  Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in a child table

- Error: 1763 SQLSTATE: HY000 (ER_SQLTHREAD_WITH_SECURE_SLAVE)

  Message: Setting authentication options is not possible when only the Slave SQL Thread is being started.

- Error: 1764 SQLSTATE: HY000 (ER_TABLE_HAS_NO_FT)

  Message: The table does not have FULLTEXT index to support this query

- Error: 1765 SQLSTATE: HY000 (ER_VARIABLE_NOT_SETTABLE_IN_SF_OR_TRIGGER)

  Message: The system variable %s cannot be set in stored functions or triggers.

- Error: 1766 SQLSTATE: HY000 (ER_VARIABLE_NOT_SETTABLE_IN_TRANSACTION)

  Message: The system variable %s cannot be set when there is an ongoing transaction.

- Error: 1769 SQLSTATE: HY000 (ER_SET_STATEMENT_CANNOT_INVOKE_FUNCTION)

  Message: The statement 'SET %s' cannot invoke a stored function.

- Error: 1770 SQLSTATE: HY000 (ER_GTID_NEXT_CANT_BE_AUTOMATIC_IF_GTID_NEXT_LIST_IS_NON_NULL)

  Message: The system variable @@SESSION.GTID_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID_NEXT_LIST is non-NULL.

- Error: 1772 SQLSTATE: HY000 (ER_MALFORMED_GTID_SET_SPECIFICATION)

  Message: Malformed GTID set specification '%s'.

- Error: 1773 SQLSTATE: HY000 (ER_MALFORMED_GTID_SET_ENCODING)

  Message: Malformed GTID set encoding.

- Error: 1774 SQLSTATE: HY000 (ER_MALFORMED_GTID_SPECIFICATION)

  Message: Malformed GTID specification '%s'.

- Error: 1775 SQLSTATE: HY000 (ER_GNO_EXHAUSTED)

  Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server_uuid.

- Error: 1776 SQLSTATE: HY000 (ER_BAD_SLAVE_AUTO_POSITION)

  Message: Parameters MASTER_LOG_FILE, MASTER_LOG_POS, RELAY_LOG_FILE and RELAY_LOG_POS cannot be set when MASTER_AUTO_POSITION is active.

- Error: 1777 SQLSTATE: HY000 (ER_AUTO_POSITION_REQUIRES_GTID_MODE_NOT_OFF)

  Message: CHANGE MASTER TO MASTER_AUTO_POSITION = 1 cannot be executed because @@GLOBAL.GTID_MODE = OFF.

- Error: 1778 SQLSTATE: HY000 (ER_CANT_DO_IMPLICIT_COMMIT_IN_TRX_WHEN_GTID_NEXT_IS_SET)

  Message: Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID_NEXT == 'UUID:NUMBER'.

- Error: 1779 SQLSTATE: HY000 (ER_GTID_MODE_ON_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON)

  Message: GTID_MODE = ON requires ENFORCE_GTID_CONSISTENCY = ON.

- Error: 1781 SQLSTATE: HY000 (ER_CANT_SET_GTID_NEXT_TO_GTID_WHEN_GTID_MODE_IS_OFF)

  Message: @@SESSION.GTID_NEXT cannot be set to UUID:NUMBER when @@GLOBAL.GTID_MODE = OFF.

- Error: 1782 SQLSTATE: HY000 (ER_CANT_SET_GTID_NEXT_TO_ANONYMOUS_WHEN_GTID_MODE_IS_ON)

  Message: @@SESSION.GTID_NEXT cannot be set to ANONYMOUS when @@GLOBAL.GTID_MODE = ON.

- Error: 1783 SQLSTATE: HY000 (ER_CANT_SET_GTID_NEXT_LIST_TO_NON_NULL_WHEN_GTID_MODE_IS_OFF)

  Message: @@SESSION.GTID_NEXT_LIST cannot be set to a non-NULL value when @@GLOBAL.GTID_MODE = OFF.

- Error: 1785 SQLSTATE: HY000 (ER_GTID_UNSAFE_NON_TRANSACTIONAL_TABLE)

  Message: Statement violates GTID consistency: Updates to non-transactional tables can only be done in either autocommitted statements or single-statement transactions, and never in the same statement as updates to transactional tables.

- Error: 1786 SQLSTATE: HY000 (ER_GTID_UNSAFE_CREATE_SELECT)

  Message: Statement violates GTID consistency: CREATE TABLE ... SELECT.

- Error: 1787 SQLSTATE: HY000 (ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION)

  Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE can only be executed outside transactional context. These statements are also not allowed in a function or trigger because functions and triggers are also considered to be multi-statement transactions.

- Error: 1788 SQLSTATE: HY000 (ER_GTID_MODE_CAN_ONLY_CHANGE_ONE_STEP_AT_A_TIME)

Message: The value of @@GLOBAL.GTID_MODE can only be changed one step at a time: OFF <-> OFF_PERMISSIVE <-> ON_PERMISSIVE <-> ON. Also note that this value must be stepped up or down simultaneously on all servers. See the Manual for instructions.

- Error: 1789 SQLSTATE: HY000 (ER_MASTER_HAS_PURGED_REQUIRED_GTIDS)

  Message: The slave is connecting using CHANGE MASTER TO MASTER_AUTO_POSITION = 1, but the master has purged binary logs containing GTIDs that the slave requires.

- Error: 1790 SQLSTATE: HY000 (ER_CANT_SET_GTID_NEXT_WHEN_OWNING_GTID)

  Message: @@SESSION.GTID_NEXT cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- Error: 1791 SQLSTATE: HY000 (ER_UNKNOWN_EXPLAIN_FORMAT)

  Message: Unknown EXPLAIN format name: '%s'

- Error: 1792 SQLSTATE: 25006 (ER_CANT_EXECUTE_IN_READ_ONLY_TRANSACTION)

  Message: Cannot execute statement in a READ ONLY transaction.

- Error: 1793 SQLSTATE: HY000 (ER_TOO_LONG_TABLE_PARTITION_COMMENT)

  Message: Comment for table partition '%s' is too long (max = %lu)

- Error: 1794 SQLSTATE: HY000 (ER_SLAVE_CONFIGURATION)

  Message: Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional error messages can be found in the MySQL error log.

- Error: 1795 SQLSTATE: HY000 (ER_INNODB_FT_LIMIT)

  Message: InnoDB presently supports one FULLTEXT index creation at a time

- Error: 1796 SQLSTATE: HY000 (ER_INNODB_NO_FT_TEMP_TABLE)

  Message: Cannot create FULLTEXT index on temporary InnoDB table

- Error: 1797 SQLSTATE: HY000 (ER_INNODB_FT_WRONG_DOCID_COLUMN)

  Message: Column '%s' is of wrong type for an InnoDB FULLTEXT index

- Error: 1798 SQLSTATE: HY000 (ER_INNODB_FT_WRONG_DOCID_INDEX)

  Message: Index '%s' is of wrong type for an InnoDB FULLTEXT index

- Error: 1799 SQLSTATE: HY000 (ER_INNODB_ONLINE_LOG_TOO_BIG)

  Message: Creating index '%s' required more than 'innodb_online_alter_log_max_size' bytes of modification log. Please try again.

- Error: 1800 SQLSTATE: HY000 (ER_UNKNOWN_ALTER_ALGORITHM)

  Message: Unknown ALGORITHM '%s'

- Error: 1801 SQLSTATE: HY000 (ER_UNKNOWN_ALTER_LOCK)

  Message: Unknown LOCK type '%s'

- Error: 1802 SQLSTATE: HY000 (ER_MTS_CHANGE_MASTER_CANT_RUN_WITH_GAPS)

  Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.

- Error: 1803 SQLSTATE: HY000 (ER_MTS_RECOVERY_FAILURE)

  Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.

- Error: 1804 SQLSTATE: HY000 (ER_MTS_RESET_WORKERS)

  Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.

- Error: 1805 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_CORRUPTED_V2)

  Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted

- Error: 1806 SQLSTATE: HY000 (ER_SLAVE_SILENT_RETRY_TRANSACTION)

  Message: Slave must silently retry current transaction

- Error: 1807 SQLSTATE: HY000 (ER_DISCARD_FK_CHECKS_RUNNING)

  Message: There is a foreign key check running on table '%s'. Cannot discard the table.

- Error: 1808 SQLSTATE: HY000 (ER_TABLE_SCHEMA_MISMATCH)

  Message: Schema mismatch (%s)

- Error: 1809 SQLSTATE: HY000 (ER_TABLE_IN_SYSTEM_TABLESPACE)

  Message: Table '%s' in system tablespace

- Error: 1810 SQLSTATE: HY000 (ER_IO_READ_ERROR)

  Message: IO Read error: (%lu, %s) %s

- Error: 1811 SQLSTATE: HY000 (ER_IO_WRITE_ERROR)

  Message: IO Write error: (%lu, %s) %s

- Error: 1812 SQLSTATE: HY000 (ER_TABLESPACE_MISSING)

  Message: Tablespace is missing for table %s.

- Error: 1813 SQLSTATE: HY000 (ER_TABLESPACE_EXISTS)

  Message: Tablespace '%s' exists.

- Error: 1814 SQLSTATE: HY000 (ER_TABLESPACE_DISCARDED)

  Message: Tablespace has been discarded for table '%s'

- Error: 1815 SQLSTATE: HY000 (ER_INTERNAL_ERROR)

  Message: Internal error: %s

- Error: 1816 SQLSTATE: HY000 (ER_INNODB_IMPORT_ERROR)

  Message: ALTER TABLE %s IMPORT TABLESPACE failed with error %lu : '%s'

- Error: 1817 SQLSTATE: HY000 (ER_INNODB_INDEX_CORRUPT)

  Message: Index corrupt: %s

- Error: 1818 SQLSTATE: HY000 (ER_INVALID_YEAR_COLUMN_LENGTH)

Message: Supports only YEAR or YEAR(4) column.

- Error: 1819 SQLSTATE: HY000 (ER_NOT_VALID_PASSWORD)

  Message: Your password does not satisfy the current policy requirements

- Error: 1820 SQLSTATE: HY000 (ER_MUST_CHANGE_PASSWORD)

  Message: You must reset your password using ALTER USER statement before executing this statement.

- Error: 1821 SQLSTATE: HY000 (ER_FK_NO_INDEX_CHILD)

  Message: Failed to add the foreign key constaint. Missing index for constraint '%s' in the foreign table '%s'

- Error: 1822 SQLSTATE: HY000 (ER_FK_NO_INDEX_PARENT)

  Message: Failed to add the foreign key constaint. Missing index for constraint '%s' in the referenced table '%s'

- Error: 1823 SQLSTATE: HY000 (ER_FK_FAIL_ADD_SYSTEM)

  Message: Failed to add the foreign key constraint '%s' to system tables

- Error: 1824 SQLSTATE: HY000 (ER_FK_CANNOT_OPEN_PARENT)

  Message: Failed to open the referenced table '%s'

- Error: 1825 SQLSTATE: HY000 (ER_FK_INCORRECT_OPTION)

  Message: Failed to add the foreign key constraint on table '%s'. Incorrect options in FOREIGN KEY constraint '%s'

- Error: 1826 SQLSTATE: HY000 (ER_FK_DUP_NAME)

  Message: Duplicate foreign key constraint name '%s'

- Error: 1827 SQLSTATE: HY000 (ER_PASSWORD_FORMAT)

  Message: The password hash doesn't have the expected format. Check if the correct password algorithm is being used with the PASSWORD() function.

- Error: 1828 SQLSTATE: HY000 (ER_FK_COLUMN_CANNOT_DROP)

  Message: Cannot drop column '%s': needed in a foreign key constraint '%s'

- Error: 1829 SQLSTATE: HY000 (ER_FK_COLUMN_CANNOT_DROP_CHILD)

  Message: Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'

- Error: 1830 SQLSTATE: HY000 (ER_FK_COLUMN_NOT_NULL)

  Message: Column '%s' cannot be NOT NULL: needed in a foreign key constraint '%s' SET NULL

- Error: 1831 SQLSTATE: HY000 (ER_DUP_INDEX)

  Message: Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.

- Error: 1832 SQLSTATE: HY000 (ER_FK_COLUMN_CANNOT_CHANGE)

  Message: Cannot change column '%s': used in a foreign key constraint '%s'

- Error: 1833 SQLSTATE: HY000 (ER_FK_COLUMN_CANNOT_CHANGE_CHILD)

  Message: Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'

- Error: 1835 SQLSTATE: HY000 (ER_MALFORMED_PACKET)

  Message: Malformed communication packet.

- Error: 1836 SQLSTATE: HY000 (ER_READ_ONLY_MODE)

  Message: Running in read-only mode

- Error: 1837 SQLSTATE: HY000 (ER_GTID_NEXT_TYPE_UNDEFINED_GROUP)

  Message: When @@SESSION.GTID_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID_NEXT is '%s'.

- Error: 1838 SQLSTATE: HY000 (ER_VARIABLE_NOT_SETTABLE_IN_SP)

  Message: The system variable %s cannot be set in stored procedures.

- Error: 1840 SQLSTATE: HY000 (ER_CANT_SET_GTID_PURGED_WHEN_GTID_EXECUTED_IS_NOT_EMPTY)

  Message: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.

- Error: 1841 SQLSTATE: HY000 (ER_CANT_SET_GTID_PURGED_WHEN_OWNED_GTIDS_IS_NOT_EMPTY)

  Message: @@GLOBAL.GTID_PURGED can only be set when there are no ongoing transactions (not even in other clients).

- Error: 1842 SQLSTATE: HY000 (ER_GTID_PURGED_WAS_CHANGED)

  Message: @@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.

- Error: 1843 SQLSTATE: HY000 (ER_GTID_EXECUTED_WAS_CHANGED)

  Message: @@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.

- Error: 1844 SQLSTATE: HY000 (ER_BINLOG_STMT_MODE_AND_NO_REPL_TABLES)

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.

- Error: 1845 SQLSTATE: 0A000 (ER_ALTER_OPERATION_NOT_SUPPORTED)

  Message: %s is not supported for this operation. Try %s.

- Error: 1846 SQLSTATE: 0A000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON)

  Message: %s is not supported. Reason: %s. Try %s.

- Error: 1847 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COPY)

  Message: COPY algorithm requires a lock

- Error: 1848 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_PARTITION)

  Message: Partition specific operations do not yet support LOCK/ALGORITHM

- Error: 1849 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_RENAME)

  Message: Columns participating in a foreign key are renamed

- Error: 1850 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COLUMN_TYPE)

  Message: Cannot change column type INPLACE

- Error: 1851 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_CHECK)

  Message: Adding foreign keys needs foreign_key_checks=OFF

- Error: 1853 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOPK)

  Message: Dropping a primary key is not allowed without also adding a new primary key

- Error: 1854 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_AUTOINC)

  Message: Adding an auto-increment column requires a lock

- Error: 1855 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_HIDDEN_FTS)

  Message: Cannot replace hidden FTS_DOC_ID with a user-visible one

- Error: 1856 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_CHANGE_FTS)

  Message: Cannot drop or rename FTS_DOC_ID

- Error: 1857 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FTS)

  Message: Fulltext index creation requires a lock

- Error: 1858 SQLSTATE: HY000 (ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE)

  Message: sql_slave_skip_counter can not be set when the server is running with @@GLOBAL.GTID_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction

- Error: 1859 SQLSTATE: 23000 (ER_DUP_UNKNOWN_IN_INDEX)

  Message: Duplicate entry for key '%s'

- Error: 1860 SQLSTATE: HY000 (ER_IDENT_CAUSES_TOO_LONG_PATH)

  Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.

- Error: 1861 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOT_NULL)

  Message: cannot silently convert NULL values, as required in this SQL_MODE

- Error: 1862 SQLSTATE: HY000 (ER_MUST_CHANGE_PASSWORD_LOGIN)

  Message: Your password has expired. To log in you must change it using a client that supports expired passwords.

- Error: 1863 SQLSTATE: HY000 (ER_ROW_IN_WRONG_PARTITION)

  Message: Found a row in wrong partition %s

- Error: 1864 SQLSTATE: HY000 (ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX)

  Message: Cannot schedule event %s, relay-log name %s, position %s to Worker thread because its size %lu exceeds %lu of slave_pending_jobs_size_max.

- Error: 1866 SQLSTATE: HY000 (ER_BINLOG_LOGICAL_CORRUPTION)

  Message: The binary log file '%s' is logically corrupted: %s

- Error: 1867 SQLSTATE: HY000 (ER_WARN_PURGE_LOG_IN_USE)

  Message: file %s was not purged because it was being read by %d thread(s), purged only %d out of %d files.

- Error: 1868 SQLSTATE: HY000 (ER_WARN_PURGE_LOG_IS_ACTIVE)

  Message: file %s was not purged because it is the active log file.

- Error: 1869 SQLSTATE: HY000 (ER_AUTO_INCREMENT_CONFLICT)

  Message: Auto-increment value in UPDATE conflicts with internally generated values

- Error: 1870 SQLSTATE: HY000 (WARN_ON_BLOCKHOLE_IN_RBR)

  Message: Row events are not logged for %s statements that modify BLACKHOLE tables in row format. Table(s): '%s'

- Error: 1871 SQLSTATE: HY000 (ER_SLAVE_MI_INIT_REPOSITORY)

  Message: Slave failed to initialize master info structure from the repository

- Error: 1872 SQLSTATE: HY000 (ER_SLAVE_RLI_INIT_REPOSITORY)

  Message: Slave failed to initialize relay log info structure from the repository

- Error: 1873 SQLSTATE: 28000 (ER_ACCESS_DENIED_CHANGE_USER_ERROR)

  Message: Access denied trying to change to user '%s'@'%s' (using password: %s). Disconnecting.

- Error: 1874 SQLSTATE: HY000 (ER_INNODB_READ_ONLY)

  Message: InnoDB is in read only mode.

- Error: 1875 SQLSTATE: HY000 (ER_STOP_SLAVE_SQL_THREAD_TIMEOUT)

  Message: STOP SLAVE command execution is incomplete: Slave SQL thread got the stop signal, thread is busy, SQL thread will stop once the current task is complete.

- Error: 1876 SQLSTATE: HY000 (ER_STOP_SLAVE_IO_THREAD_TIMEOUT)

  Message: STOP SLAVE command execution is incomplete: Slave IO thread got the stop signal, thread is busy, IO thread will stop once the current task is complete.

- Error: 1877 SQLSTATE: HY000 (ER_TABLE_CORRUPT)

  Message: Operation cannot be performed. The table '%s.%s' is missing, corrupt or contains bad data.

- Error: 1878 SQLSTATE: HY000 (ER_TEMP_FILE_WRITE_FAILURE)

  Message: Temporary file write failure.

- Error: 1879 SQLSTATE: HY000 (ER_INNODB_FT_AUX_NOT_HEX_ID)

Message: Upgrade index name failed, please use create index(alter table) algorithm copy to rebuild index.

- Error: 1880 SQLSTATE: HY000 (ER_OLD_TEMPORALS_UPGRADED)

  Message: TIME/TIMESTAMP/DATETIME columns of old format have been upgraded to the new format.

- Error: 1881 SQLSTATE: HY000 (ER_INNODB_FORCED_RECOVERY)

  Message: Operation not allowed when innodb_forced_recovery > 0.

- Error: 1882 SQLSTATE: HY000 (ER_AES_INVALID_IV)

  Message: The initialization vector supplied to %s is too short. Must be at least %d bytes long

- Error: 1883 SQLSTATE: HY000 (ER_PLUGIN_CANNOT_BE_UNINSTALLED)

  Message: Plugin '%s' cannot be uninstalled now. %s

- Error: 1884 SQLSTATE: HY000 (ER_GTID_UNSAFE_BINLOG_SPLITTABLE_STATEMENT_AND_GTID_GROUP)

  Message: Cannot execute statement because it needs to be written to the binary log as multiple statements, and this is not allowed when @@SESSION.GTID_NEXT == 'UUID:NUMBER'.

- Error: 1885 SQLSTATE: HY000 (ER_SLAVE_HAS_MORE_GTIDS_THAN_MASTER)

  Message: Slave has more GTIDs than the master has, using the master's SERVER_UUID. This may indicate that the end of the binary log was truncated or that the last binary log file was lost, e.g., after a power or disk failure when sync_binlog != 1. The master may or may not have rolled back transactions that were already replicated to the slave. Suggest to replicate any transactions that master has rolled back from slave to master, and/or commit empty transactions on master to account for transactions that have been committed on master but are not included in GTID_EXECUTED.

- Error: 3000 SQLSTATE: HY000 (ER_FILE_CORRUPT)

  Message: File %s is corrupted

- Error: 3001 SQLSTATE: HY000 (ER_ERROR_ON_MASTER)

  Message: Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL_SLAVE_SKIP_COUNTER=1; START SLAVE;. Query:'%s'

- Error: 3002 SQLSTATE: HY000 (ER_INCONSISTENT_ERROR)

  Message: Query caused different errors on master and slave. Error on master: message (format)='%s' error code=%d; Error on slave:actual message='%s', error code=%d. Default database:'%s'. Query:'%s'

- Error: 3003 SQLSTATE: HY000 (ER_STORAGE_ENGINE_NOT_LOADED)

  Message: Storage engine for table '%s'.'%s' is not loaded.

- Error: 3004 SQLSTATE: 0Z002 (ER_GET_STACKED_DA_WITHOUT_ACTIVE_HANDLER)

  Message: GET STACKED DIAGNOSTICS when handler not active

- Error: 3005 SQLSTATE: HY000 (ER_WARN_LEGACY_SYNTAX_CONVERTED)

  Message: %s is no longer supported. The statement was converted to %s.

- Error: 3006 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN)

  Message: Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.

- Error: 3007 SQLSTATE: HY000 (ER_CANNOT_DISCARD_TEMPORARY_TABLE)

  Message: Cannot DISCARD/IMPORT tablespace associated with temporary table

- Error: 3008 SQLSTATE: HY000 (ER_FK_DEPTH_EXCEEDED)

  Message: Foreign key cascade delete/update exceeds max depth of %d.

- Error: 3009 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE_V2)

  Message: Column count of %s.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- Error: 3010 SQLSTATE: HY000 (ER_WARN_TRIGGER_DOESNT_HAVE_CREATED)

  Message: Trigger %s.%s.%s does not have CREATED attribute.

- Error: 3011 SQLSTATE: HY000 (ER_REFERENCED_TRG_DOES_NOT_EXIST)

  Message: Referenced trigger '%s' for the given action time and event type does not exist.

- Error: 3012 SQLSTATE: HY000 (ER_EXPLAIN_NOT_SUPPORTED)

  Message: EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE

- Error: 3013 SQLSTATE: HY000 (ER_INVALID_FIELD_SIZE)

  Message: Invalid size for column '%s'.

- Error: 3014 SQLSTATE: HY000 (ER_MISSING_HA_CREATE_OPTION)

  Message: Table storage engine '%s' found required create option missing

- Error: 3015 SQLSTATE: HY000 (ER_ENGINE_OUT_OF_MEMORY)

  Message: Out of memory in storage engine '%s'.

- Error: 3016 SQLSTATE: HY000 (ER_PASSWORD_EXPIRE_ANONYMOUS_USER)

  Message: The password for anonymous user cannot be expired.

- Error: 3017 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_MUST_STOP)

  Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD first

- Error: 3018 SQLSTATE: HY000 (ER_NO_FT_MATERIALIZED_SUBQUERY)

  Message: Cannot create FULLTEXT index on materialized subquery

- Error: 3019 SQLSTATE: HY000 (ER_INNODB_UNDO_LOG_FULL)

  Message: Undo Log error: %s

- Error: 3020 SQLSTATE: 2201E (ER_INVALID_ARGUMENT_FOR_LOGARITHM)

  Message: Invalid argument for logarithm

- Error: 3021 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP)

Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO_THREAD FOR CHANNEL '%s' first.

- Error: 3022 SQLSTATE: HY000 (ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO)

  Message: This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave_open_temp_tables = 0.

- Error: 3023 SQLSTATE: HY000 (ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS)

  Message: CHANGE MASTER TO with a MASTER_LOG_FILE clause but no MASTER_LOG_POS clause may not be safe. The old position value may not be valid for the new binary log file.

- Error: 3024 SQLSTATE: HY000 (ER_QUERY_TIMEOUT)

  Message: Query execution was interrupted, maximum statement execution time exceeded

- Error: 3025 SQLSTATE: HY000 (ER_NON_RO_SELECT_DISABLE_TIMER)

  Message: Select is not a read only statement, disabling timer

- Error: 3026 SQLSTATE: HY000 (ER_DUP_LIST_ENTRY)

  Message: Duplicate entry '%s'.

- Error: 3028 SQLSTATE: HY000 (ER_AGGREGATE_ORDER_FOR_UNION)

  Message: Expression #%u of ORDER BY contains aggregate function and applies to a UNION

- Error: 3029 SQLSTATE: HY000 (ER_AGGREGATE_ORDER_NON_AGG_QUERY)

  Message: Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query

- Error: 3030 SQLSTATE: HY000 (ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR)

  Message: Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.

- Error: 3031 SQLSTATE: HY000 (ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER)

  Message: slave_preserve_commit_order is not supported %s.

- Error: 3032 SQLSTATE: HY000 (ER_SERVER_OFFLINE_MODE)

  Message: The server is currently in offline mode

- Error: 3033 SQLSTATE: HY000 (ER_GIS_DIFFERENT_SRIDS)

  Message: Binary geometry function %s given two geometries of different srids: %u and %u, which should have been identical.

  Geometry values passed as arguments to spatial functions must have the same SRID value.

- Error: 3034 SQLSTATE: HY000 (ER_GIS_UNSUPPORTED_ARGUMENT)

  Message: Calling geometry function %s with unsupported types of arguments.

  A spatial function was called with a combination of argument types that the function does not support.

- Error: 3035 SQLSTATE: HY000 (ER_GIS_UNKNOWN_ERROR)

  Message: Unknown GIS error occured in function %s.

- Error: 3036 SQLSTATE: HY000 (ER_GIS_UNKNOWN_EXCEPTION)

  Message: Unknown exception caught in GIS function %s.

- Error: 3037 SQLSTATE: 22023 (ER_GIS_INVALID_DATA)

  Message: Invalid GIS data provided to function %s.

  A spatial function was called with an argument not recognized as a valid geometry value.

- Error: 3038 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION)

  Message: The geometry has no data in function %s.

- Error: 3039 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_CENTROID_EXCEPTION)

  Message: Unable to calculate centroid because geometry is empty in function %s.

- Error: 3040 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION)

  Message: Geometry overlay calculation error: geometry data is invalid in function %s.

- Error: 3041 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION)

  Message: Geometry turn info calculation error: geometry data is invalid in function %s.

- Error: 3042 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION)

  Message: Analysis procedures of intersection points interrupted unexpectedly in function %s.

- Error: 3043 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_UNKNOWN_EXCEPTION)

  Message: Unknown exception thrown in function %s.

- Error: 3044 SQLSTATE: HY000 (ER_STD_BAD_ALLOC_ERROR)

  Message: Memory allocation error: %s in function %s.

- Error: 3045 SQLSTATE: HY000 (ER_STD_DOMAIN_ERROR)

  Message: Domain error: %s in function %s.

- Error: 3046 SQLSTATE: HY000 (ER_STD_LENGTH_ERROR)

  Message: Length error: %s in function %s.

- Error: 3047 SQLSTATE: HY000 (ER_STD_INVALID_ARGUMENT)

  Message: Invalid argument error: %s in function %s.

- Error: 3048 SQLSTATE: HY000 (ER_STD_OUT_OF_RANGE_ERROR)

  Message: Out of range error: %s in function %s.

- Error: 3049 SQLSTATE: HY000 (ER_STD_OVERFLOW_ERROR)

  Message: Overflow error error: %s in function %s.

- Error: 3050 SQLSTATE: HY000 (ER_STD_RANGE_ERROR)

Message: Range error: %s in function %s.

- Error: 3051 SQLSTATE: HY000 (ER_STD_UNDERFLOW_ERROR)

  Message: Underflow error: %s in function %s.

- Error: 3052 SQLSTATE: HY000 (ER_STD_LOGIC_ERROR)

  Message: Logic error: %s in function %s.

- Error: 3053 SQLSTATE: HY000 (ER_STD_RUNTIME_ERROR)

  Message: Runtime error: %s in function %s.

- Error: 3054 SQLSTATE: HY000 (ER_STD_UNKNOWN_EXCEPTION)

  Message: Unknown exception: %s in function %s.

- Error: 3055 SQLSTATE: HY000 (ER_GIS_DATA_WRONG_ENDIANESS)

  Message: Geometry byte string must be little endian.

- Error: 3056 SQLSTATE: HY000 (ER_CHANGE_MASTER_PASSWORD_LENGTH)

  Message: The password provided for the replication user exceeds the maximum length of 32 characters

- Error: 3057 SQLSTATE: 42000 (ER_USER_LOCK_WRONG_NAME)

  Message: Incorrect user-level lock name '%s'.

- Error: 3058 SQLSTATE: HY000 (ER_USER_LOCK_DEADLOCK)

  Message: Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.

  This error is returned when the metdata locking subsystem detects a deadlock for an attempt to acquire a named lock with GET_LOCK.

- Error: 3059 SQLSTATE: HY000 (ER_REPLACE_INACCESSIBLE_ROWS)

  Message: REPLACE cannot be executed as it requires deleting rows that are not in the view

- Error: 3060 SQLSTATE: HY000 (ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_GIS)

  Message: Do not support online operation on table with GIS index

- Error: 3061 SQLSTATE: 42000 (ER_ILLEGAL_USER_VAR)

  Message: User variable name '%s' is illegal

- Error: 3062 SQLSTATE: HY000 (ER_GTID_MODE_OFF)

  Message: Cannot %s when GTID_MODE = OFF.

- Error: 3064 SQLSTATE: HY000 (ER_INCORRECT_TYPE)

  Message: Incorrect type for argument %s in function %s.

- Error: 3065 SQLSTATE: HY000 (ER_FIELD_IN_ORDER_NOT_SELECT)

  Message: Expression #%u of ORDER BY clause is not in SELECT list, references column '%s' which is not in SELECT list; this is incompatible with %s

- Error: 3066 SQLSTATE: HY000 (ER_AGGREGATE_IN_ORDER_NOT_SELECT)

  Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s

- Error: 3067 SQLSTATE: HY000 (ER_INVALID_RPL_WILD_TABLE_FILTER_PATTERN)

  Message: Supplied filter list contains a value which is not in the required format 'db_pattern.table_pattern'

- Error: 3068 SQLSTATE: 08S01 (ER_NET_OK_PACKET_TOO_LARGE)

  Message: OK packet too large

- Error: 3069 SQLSTATE: HY000 (ER_INVALID_JSON_DATA)

  Message: Invalid JSON data provided to function %s: %s

- Error: 3070 SQLSTATE: HY000 (ER_INVALID_GEOJSON_MISSING_MEMBER)

  Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'

- Error: 3071 SQLSTATE: HY000 (ER_INVALID_GEOJSON_WRONG_TYPE)

  Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'

- Error: 3072 SQLSTATE: HY000 (ER_INVALID_GEOJSON_UNSPECIFIED)

  Message: Invalid GeoJSON data provided to function %s

- Error: 3073 SQLSTATE: HY000 (ER_DIMENSION_UNSUPPORTED)

  Message: Unsupported number of coordinate dimensions in function %s: Found %u, expected %u

- Error: 3074 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_DOES_NOT_EXIST)

  Message: Slave channel '%s' does not exist.

- Error: 3076 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG)

  Message: Couldn't create channel: Channel name is either invalid or too long.

- Error: 3077 SQLSTATE: HY000 (ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY)

  Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.

- Error: 3079 SQLSTATE: HY000 (ER_SLAVE_MULTIPLE_CHANNELS_CMD)

  Message: Multiple channels exist on the slave. Please provide channel name as an argument.

- Error: 3080 SQLSTATE: HY000 (ER_SLAVE_MAX_CHANNELS_EXCEEDED)

  Message: Maximum number of replication channels allowed exceeded.

- Error: 3081 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_MUST_STOP)

  Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first

- Error: 3082 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_NOT_RUNNING)

  Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'

- Error: 3083 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_WAS_RUNNING)

  Message: Replication thread(s) for channel '%s' are already runnning.

- Error: 3084 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_WAS_NOT_RUNNING)

  Message: Replication thread(s) for channel '%s' are already stopped.

- Error: 3085 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP)

  Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD FOR CHANNEL '%s' first.

- Error: 3086 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER)

  Message: When sql_slave_skip_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL_THREAD]'. Value of sql_slave_skip_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql_slave_skip_counter.

- Error: 3087 SQLSTATE: HY000 (ER_WRONG_FIELD_WITH_GROUP_V2)

  Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql_mode=only_full_group_by

- Error: 3088 SQLSTATE: HY000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2)

  Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql_mode=only_full_group_by

- Error: 3089 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYSVAR_UPDATE)

  Message: Updating '%s' is deprecated. It will be made read-only in a future release.

- Error: 3090 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SQLMODE)

  Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

- Error: 3091 SQLSTATE: HY000 (ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID)

  Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID_NEXT='%s'; (3) DROP DATABASE `%s`.

- Error: 3092 SQLSTATE: HY000 (ER_GROUP_REPLICATION_CONFIGURATION)

  Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

- Error: 3093 SQLSTATE: HY000 (ER_GROUP_REPLICATION_RUNNING)

  Message: The START GROUP_REPLICATION command failed since the group is already running.

- Error: 3094 SQLSTATE: HY000 (ER_GROUP_REPLICATION_APPLIER_INIT_ERROR)

  Message: The START GROUP_REPLICATION command failed as the applier module failed to start.

- Error: 3095 SQLSTATE: HY000 (ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT)

  Message: The STOP GROUP_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.

- Error: 3096 SQLSTATE: HY000 (ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR)

  Message: The START GROUP_REPLICATION command failed as there was an error when initializing the group communication layer.

- Error: 3097 SQLSTATE: HY000 (ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR)

  Message: The START GROUP_REPLICATION command failed as there was an error when joining the communication group.

- Error: 3098 SQLSTATE: HY000 (ER_BEFORE_DML_VALIDATION_ERROR)

  Message: The table does not comply with the requirements by an external plugin.

- Error: 3099 SQLSTATE: HY000 (ER_PREVENTS_VARIABLE_WITHOUT_RBR)

  Message: Cannot change the value of variable %s without binary log format as ROW.

  transaction_write_set_extraction option value is set and binlog_format is not ROW.

- Error: 3100 SQLSTATE: HY000 (ER_RUN_HOOK_ERROR)

  Message: Error on observer while running replication hook '%s'.

- Error: 3101 SQLSTATE: 40000 (ER_TRANSACTION_ROLLBACK_DURING_COMMIT)

  Message: Plugin instructed the server to rollback the current transaction.

  When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See Chapter 21, *Group Replication*.

- Error: 3102 SQLSTATE: HY000 (ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED)

  Message: Expression of generated column '%s' contains a disallowed function.

- Error: 3103 SQLSTATE: HY000 (ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN)

  Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions

- Error: 3104 SQLSTATE: HY000 (ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN)

  Message: Cannot define foreign key with %s clause on a generated column.

- Error: 3105 SQLSTATE: HY000 (ER_NON_DEFAULT_VALUE_FOR_GENERATED_COLUMN)

  Message: The value specified for generated column '%s' in table '%s' is not allowed.

- Error: 3106 SQLSTATE: HY000 (ER_UNSUPPORTED_ACTION_ON_GENERATED_COLUMN)

  Message: '%s' is not supported for generated columns.

- Error: 3107 SQLSTATE: HY000 (ER_GENERATED_COLUMN_NON_PRIOR)

  Message: Generated column can refer only to generated columns defined prior to it.

  To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.

- Error: 3108 SQLSTATE: HY000 (ER_DEPENDENT_BY_GENERATED_COLUMN)

Message: Column '%s' has a generated column dependency.

You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.

- Error: 3109 SQLSTATE: HY000 (ER_GENERATED_COLUMN_REF_AUTO_INC)

  Message: Generated column '%s' cannot refer to auto-increment column.

- Error: 3110 SQLSTATE: HY000 (ER_FEATURE_NOT_AVAILABLE)

  Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'

- Error: 3111 SQLSTATE: HY000 (ER_CANT_SET_GTID_MODE)

  Message: SET @@GLOBAL.GTID_MODE = %s is not allowed because %s.

- Error: 3112 SQLSTATE: HY000 (ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF)

  Message: The replication receiver thread%s cannot start in AUTO_POSITION mode: this server uses @@GLOBAL.GTID_MODE = OFF.

- Error: 3113 SQLSTATE: HY000 (ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION)

  Message: Cannot replicate anonymous transaction when AUTO_POSITION = 1, at file %s, position %lld.

- Error: 3114 SQLSTATE: HY000 (ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON)

  Message: Cannot replicate anonymous transaction when @@GLOBAL.GTID_MODE = ON, at file %s, position %lld.

- Error: 3115 SQLSTATE: HY000 (ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF)

  Message: Cannot replicate GTID-transaction when @@GLOBAL.GTID_MODE = OFF, at file %s, position %lld.

- Error: 3116 SQLSTATE: HY000 (ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX)

  Message: Cannot set ENFORCE_GTID_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

  ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS was renamed to ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX.

- Error: 3117 SQLSTATE: HY000 (ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX)

  Message: There are ongoing transactions that violate GTID consistency.

  ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS was renamed to ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX.

- Error: 3118 SQLSTATE: HY000 (ER_ACCOUNT_HAS_BEEN_LOCKED)

  Message: Access denied for user '%s'@'%s'. Account is locked.

  The account was locked with CREATE USER ... ACCOUNT LOCK or ALTER USER ... ACCOUNT LOCK. An administrator can unlock it with ALTER USER ... ACCOUNT UNLOCK.

- Error: 3119 SQLSTATE: 42000 (ER_WRONG_TABLESPACE_NAME)

  Message: Incorrect tablespace name `%s`

- Error: 3120 SQLSTATE: HY000 (ER_TABLESPACE_IS_NOT_EMPTY)

  Message: Tablespace `%s` is not empty.

- Error: 3121 SQLSTATE: HY000 (ER_WRONG_FILE_NAME)

  Message: Incorrect File Name '%s'.

- Error: 3122 SQLSTATE: HY000 (ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION)

  Message: Inconsistent intersection points.

- Error: 3123 SQLSTATE: HY000 (ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR)

  Message: Optimizer hint syntax error

- Error: 3124 SQLSTATE: HY000 (ER_WARN_BAD_MAX_EXECUTION_TIME)

  Message: Unsupported MAX_EXECUTION_TIME

- Error: 3125 SQLSTATE: HY000 (ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME)

  Message: MAX_EXECUTION_TIME hint is supported by top-level standalone SELECT statements only

  The MAX_EXECUTION_TIME optimizer hint is supported only for SELECT statements.

- Error: 3126 SQLSTATE: HY000 (ER_WARN_CONFLICTING_HINT)

  Message: Hint %s is ignored as conflicting/duplicated

- Error: 3127 SQLSTATE: HY000 (ER_WARN_UNKNOWN_QB_NAME)

  Message: Query block name %s is not found for %s hint

- Error: 3128 SQLSTATE: HY000 (ER_UNRESOLVED_HINT_NAME)

  Message: Unresolved name %s for %s hint

- Error: 3129 SQLSTATE: HY000 (ER_WARN_ON_MODIFYING_GTID_EXECUTED_TABLE)

  Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.

- Error: 3130 SQLSTATE: HY000 (ER_PLUGGABLE_PROTOCOL_COMMAND_NOT_SUPPORTED)

  Message: Command not supported by pluggable protocols

- Error: 3131 SQLSTATE: 42000 (ER_LOCKING_SERVICE_WRONG_NAME)

  Message: Incorrect locking service lock name '%s'.

  A locking service name was specified as NULL, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-NULL, nonempty, and no more than 64 characters long.

- Error: 3132 SQLSTATE: HY000 (ER_LOCKING_SERVICE_DEADLOCK)

  Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.

- Error: 3133 SQLSTATE: HY000 (ER_LOCKING_SERVICE_TIMEOUT)

  Message: Service lock wait timeout exceeded.

- Error: 3134 SQLSTATE: HY000 (ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED)

  Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.

- Error: 3135 SQLSTATE: HY000 (ER_SQL_MODE_MERGED)

  Message: 'NO_ZERO_DATE', 'NO_ZERO_IN_DATE' and 'ERROR_FOR_DIVISION_BY_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.

- Error: 3136 SQLSTATE: HY000 (ER_VTOKEN_PLUGIN_TOKEN_MISMATCH)

  Message: Version token mismatch for %.*s. Correct value %.*s

  The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See Section 5.6.4, “Version Tokens”.

- Error: 3137 SQLSTATE: HY000 (ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND)

  Message: Version token %.*s not found.

  The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See Section 5.6.4, “Version Tokens”.

- Error: 3138 SQLSTATE: HY000 (ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID)

  Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- Error: 3139 SQLSTATE: HY000 (ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED)

  Message: %s cannot be performed on channel '%s'.

- Error: 3140 SQLSTATE: 22032 (ER_INVALID_JSON_TEXT)

  Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

- Error: 3141 SQLSTATE: 22032 (ER_INVALID_JSON_TEXT_IN_PARAM)

  Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

- Error: 3142 SQLSTATE: HY000 (ER_INVALID_JSON_BINARY_DATA)

  Message: The JSON binary value contains invalid data.

- Error: 3143 SQLSTATE: 42000 (ER_INVALID_JSON_PATH)

  Message: Invalid JSON path expression. The error is around character position %u.%s

- Error: 3144 SQLSTATE: 22032 (ER_INVALID_JSON_CHARSET)

  Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

- Error: 3145 SQLSTATE: 22032 (ER_INVALID_JSON_CHARSET_IN_FUNCTION)

  Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.

- Error: 3146 SQLSTATE: 22032 (ER_INVALID_TYPE_FOR_JSON)

Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.

- Error: 3147 SQLSTATE: 22032 (ER_INVALID_CAST_TO_JSON)

  Message: Cannot CAST value to JSON.

- Error: 3148 SQLSTATE: 42000 (ER_INVALID_JSON_PATH_CHARSET)

  Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.

- Error: 3149 SQLSTATE: 42000 (ER_INVALID_JSON_PATH_WILDCARD)

  Message: In this situation, path expressions may not contain the * and ** tokens or an array range.

- Error: 3150 SQLSTATE: 22032 (ER_JSON_VALUE_TOO_BIG)

  Message: The JSON value is too big to be stored in a JSON column.

- Error: 3151 SQLSTATE: 22032 (ER_JSON_KEY_TOO_BIG)

  Message: The JSON object contains a key name that is too long.

- Error: 3152 SQLSTATE: 42000 (ER_JSON_USED_AS_KEY)

  Message: JSON column '%s' supports indexing only via generated columns on a specified JSON path.

- Error: 3153 SQLSTATE: 42000 (ER_JSON_VACUOUS_PATH)

  Message: The path expression '$' is not allowed in this context.

- Error: 3154 SQLSTATE: 42000 (ER_JSON_BAD_ONE_OR_ALL_ARG)

  Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.

- Error: 3155 SQLSTATE: 22003 (ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE)

  Message: Out of range JSON value for CAST to %s%s from column %s at row %ld

- Error: 3156 SQLSTATE: 22018 (ER_INVALID_JSON_VALUE_FOR_CAST)

  Message: Invalid JSON value for CAST to %s%s from column %s at row %ld

- Error: 3157 SQLSTATE: 22032 (ER_JSON_DOCUMENT_TOO_DEEP)

  Message: The JSON document exceeds the maximum depth.

- Error: 3158 SQLSTATE: 22032 (ER_JSON_DOCUMENT_NULL_KEY)

  Message: JSON documents may not contain NULL member names.

- Error: 3159 SQLSTATE: HY000 (ER_SECURE_TRANSPORT_REQUIRED)

  Message: Connections using insecure transport are prohibited while --require_secure_transport=ON.

  With the require_secure_transport system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.

- Error: 3160 SQLSTATE: HY000 (ER_NO_SECURE_TRANSPORTS_CONFIGURED)

  Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require_secure_transport=ON.

The `require_secure_transport` system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the `shared_memory` system variable to enable shared-memory connections.

- Error: `3161` SQLSTATE: `HY000` (`ER_DISABLED_STORAGE_ENGINE`)

  Message: Storage engine %s is disabled (Table creation is disallowed).

  An attempt was made to create a table or tablespace using a storage engine listed in the value of the `disabled_storage_engines` system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

- Error: `3162` SQLSTATE: `HY000` (`ER_USER_DOES_NOT_EXIST`)

  Message: Authorization ID %s does not exist.

- Error: `3163` SQLSTATE: `HY000` (`ER_USER_ALREADY_EXISTS`)

  Message: Authorization ID %s already exists.

- Error: `3164` SQLSTATE: `HY000` (`ER_AUDIT_API_ABORT`)

  Message: Aborted by Audit API ('%s';%d).

  This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

- Error: `3165` SQLSTATE: `42000` (`ER_INVALID_JSON_PATH_ARRAY_CELL`)

  Message: A path expression is not a path to a cell in an array.

- Error: `3166` SQLSTATE: `HY000` (`ER_BUFPOOL_RESIZE_INPROGRESS`)

  Message: Another buffer pool resize is already in progress.

- Error: `3167` SQLSTATE: `HY000` (`ER_FEATURE_DISABLED_SEE_DOC`)

  Message: The '%s' feature is disabled; see the documentation for '%s'

- Error: `3168` SQLSTATE: `HY000` (`ER_SERVER_ISNT_AVAILABLE`)

  Message: Server isn't available

- Error: `3169` SQLSTATE: `HY000` (`ER_SESSION_WAS_KILLED`)

  Message: Session was killed

- Error: `3170` SQLSTATE: `HY000` (`ER_CAPACITY_EXCEEDED`)

  Message: Memory capacity of %llu bytes for '%s' exceeded. %s

- Error: `3171` SQLSTATE: `HY000` (`ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER`)

  Message: Range optimization was not done for this query.

- Error: `3173` SQLSTATE: `HY000` (`ER_CANT_WAIT_FOR_EXECUTED_GTID_SET_WHILE_OWNING_A_GTID`)

  Message: The client holds ownership of the GTID %s. Therefore, WAIT_FOR_EXECUTED_GTID_SET cannot wait for this GTID.

- Error: `3174` SQLSTATE: `HY000` (`ER_CANNOT_ADD_FOREIGN_BASE_COL_VIRTUAL`)

Message: Cannot add foreign key on the base column of indexed virtual column.

- Error: 3175 SQLSTATE: HY000 (ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT)

  Message: Cannot create index on virtual column whose base column has foreign constraint.

- Error: 3176 SQLSTATE: HY000 (ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE)

  Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if neccessary you can modify it with a non-XA transaction.

- Error: 3177 SQLSTATE: HY000 (ER_LOCK_REFUSED_BY_ENGINE)

  Message: Lock acquisition refused by storage engine.

- Error: 3178 SQLSTATE: HY000 (ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN)

  Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)

- Error: 3179 SQLSTATE: HY000 (ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE)

  Message: Master key rotation is not supported by storage engine.

- Error: 3181 SQLSTATE: HY000 (ER_MASTER_KEY_ROTATION_BINLOG_FAILED)

  Message: Write to binlog failed. However, master key rotation has been completed successfully.

- Error: 3182 SQLSTATE: HY000 (ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE)

  Message: Storage engine is not available.

- Error: 3183 SQLSTATE: HY000 (ER_TABLESPACE_CANNOT_ENCRYPT)

  Message: This tablespace can't be encrypted.

- Error: 3184 SQLSTATE: HY000 (ER_INVALID_ENCRYPTION_OPTION)

  Message: Invalid encryption option.

- Error: 3185 SQLSTATE: HY000 (ER_CANNOT_FIND_KEY_IN_KEYRING)

  Message: Can't find master key from keyring, please check keyring plugin is loaded.

- Error: 3186 SQLSTATE: HY000 (ER_CAPACITY_EXCEEDED_IN_PARSER)

  Message: Parser bailed out for this query.

- Error: 3187 SQLSTATE: HY000 (ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE)

  Message: Cannot alter encryption attribute by inplace algorithm.

- Error: 3188 SQLSTATE: HY000 (ER_KEYRING_UDF_KEYRING_SERVICE_ERROR)

  Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

- Error: 3189 SQLSTATE: HY000 (ER_USER_COLUMN_OLD_LENGTH)

  Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please run mysql_upgrade.

- Error: 3190 SQLSTATE: HY000 (ER_CANT_RESET_MASTER)

Message: RESET MASTER is not allowed because %s.

- Error: 3191 SQLSTATE: HY000 (ER_GROUP_REPLICATION_MAX_GROUP_SIZE)

  Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

- Error: 3192 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED)

  Message: Cannot add foreign key on the base column of stored column.

- Error: 3193 SQLSTATE: HY000 (ER_TABLE_REFERENCED)

  Message: Cannot complete the operation because table is referenced by another connection.

- Error: 3197 SQLSTATE: HY000 (ER_XA_RETRY)

  Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

  ER_XA_RETRY was added in 8.0.2.

- Error: 3198 SQLSTATE: HY000 (ER_KEYRING_AWS_UDF_AWS_KMS_ERROR)

  Message: Function %s failed due to: %s.

  ER_KEYRING_AWS_UDF_AWS_KMS_ERROR was added in 8.0.2.

- Error: 3199 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_XA)

  Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

  ER_BINLOG_UNSAFE_XA was added in 8.0.2.

- Error: 3500 SQLSTATE: HY000 (ER_UNSUPPORT_COMPRESSED_TEMPORARY_TABLE)

  Message: CREATE TEMPORARY TABLE is not allowed with ROW_FORMAT=COMPRESSED or KEY_BLOCK_SIZE.

- Error: 3501 SQLSTATE: HY000 (ER_ACL_OPERATION_FAILED)

  Message: The ACL operation failed due to the following error from SE: errcode %d - %s

- Error: 3502 SQLSTATE: HY000 (ER_UNSUPPORTED_INDEX_ALGORITHM)

  Message: This storage engine does not support the %s index algorithm, storage engine default was used instead.

- Error: 3503 SQLSTATE: 42Y07 (ER_NO_SUCH_DB)

  Message: Database '%s' doesn't exist

- Error: 3504 SQLSTATE: HY000 (ER_TOO_BIG_ENUM)

  Message: Too many enumeration values for column %s.

- Error: 3505 SQLSTATE: HY000 (ER_TOO_LONG_SET_ENUM_VALUE)

  Message: Too long enumeration/set value for column %s.

- Error: 3506 SQLSTATE: HY000 (ER_INVALID_DD_OBJECT)

Message: %s dictionary object is invalid. (%s)

- Error: 3507 SQLSTATE: HY000 (ER_UPDATING_DD_TABLE)

  Message: Failed to update %s dictionary object.

- Error: 3508 SQLSTATE: HY000 (ER_INVALID_DD_OBJECT_ID)

  Message: Dictionary object id (%lu) does not exist.

- Error: 3509 SQLSTATE: HY000 (ER_INVALID_DD_OBJECT_NAME)

  Message: Dictionary object name '%s' is invalid. (%s)

- Error: 3510 SQLSTATE: HY000 (ER_TABLESPACE_MISSING_WITH_NAME)

  Message: Tablespace %s doesn't exist.

- Error: 3511 SQLSTATE: HY000 (ER_TOO_LONG_ROUTINE_COMMENT)

  Message: Comment for routine '%s' is too long (max = %lu)

- Error: 3512 SQLSTATE: HY000 (ER_SP_LOAD_FAILED)

  Message: Failed to load routine '%s'.

- Error: 3513 SQLSTATE: HY000 (ER_INVALID_BITWISE_OPERANDS_SIZE)

  Message: Binary operands of bitwise operators must be of equal length

- Error: 3514 SQLSTATE: HY000 (ER_INVALID_BITWISE_AGGREGATE_OPERANDS_SIZE)

  Message: Aggregate bitwise functions cannot accept arguments longer than 511 bytes; consider using the SUBSTRING() function

- Error: 3515 SQLSTATE: HY000 (ER_WARN_UNSUPPORTED_HINT)

  Message: Hints aren't supported in %s

- Error: 3516 SQLSTATE: 22S01 (ER_UNEXPECTED_GEOMETRY_TYPE)

  Message: %s value is a geometry of unexpected type %s in %s.

- Error: 3517 SQLSTATE: SR002 (ER_SRS_PARSE_ERROR)

  Message: Can't parse the spatial reference system definition of SRID %u.

- Error: 3518 SQLSTATE: SR003 (ER_SRS_PROJ_PARAMETER_MISSING)

  Message: The spatial reference system definition for SRID %u does not specify the mandatory %s (EPSG %u) projection parameter.

- Error: 3519 SQLSTATE: 01000 (ER_WARN_SRS_NOT_FOUND)

  Message: There's no spatial reference system with SRID %u. Calculations in function %s will be done in SRID 0.

- Error: 3520 SQLSTATE: 22S00 (ER_SRS_NOT_CARTESIAN)

  Message: Function %s is only defined for Cartesian spatial reference systems, but one of its arguments is in SRID %u, which is not Cartesian.

- Error: 3521 SQLSTATE: SR001 (ER_SRS_NOT_CARTESIAN_UNDEFINED)

Message: Function %s is only defined for Cartesian spatial reference systems, but one of its arguments is in SRID %u, which has not been defined.

- Error: 3522 SQLSTATE: HY000 (ER_PK_INDEX_CANT_BE_INVISIBLE)

  Message: A primary key index cannot be invisible

- Error: 3523 SQLSTATE: HY000 (ER_UNKNOWN_AUTHID)

  Message: Unknown authorization ID `%s`@`%s`

- Error: 3524 SQLSTATE: HY000 (ER_FAILED_ROLE_GRANT)

  Message: Failed to grant %s` to %s

- Error: 3525 SQLSTATE: HY000 (ER_OPEN_ROLE_TABLES)

  Message: Failed to open the security system tables

- Error: 3526 SQLSTATE: HY000 (ER_FAILED_DEFAULT_ROLES)

  Message: Failed to set default roles

- Error: 3527 SQLSTATE: HY000 (ER_COMPONENTS_NO_SCHEME)

  Message: Cannot find schema in specified URN: '%s'.

- Error: 3528 SQLSTATE: HY000 (ER_COMPONENTS_NO_SCHEME_SERVICE)

  Message: Cannot acquire scheme load service implementation for schema '%s' in specified URN: '%s'.

- Error: 3529 SQLSTATE: HY000 (ER_COMPONENTS_CANT_LOAD)

  Message: Cannot load component from specified URN: '%s'.

- Error: 3530 SQLSTATE: HY000 (ER_ROLE_NOT_GRANTED)

  Message: `%s`@`%s` is not granted to `%s`@`%s`

- Error: 3531 SQLSTATE: HY000 (ER_FAILED_REVOKE_ROLE)

  Message: Could not revoke role from `%s`@`%s`

- Error: 3532 SQLSTATE: HY000 (ER_RENAME_ROLE)

  Message: Renaming of a role identifier is forbidden

- Error: 3533 SQLSTATE: HY000 (ER_COMPONENTS_CANT_ACQUIRE_SERVICE_IMPLEMENTATION)

  Message: Cannot acquire specified service implementation: '%s'.

- Error: 3534 SQLSTATE: HY000 (ER_COMPONENTS_CANT_SATISFY_DEPENDENCY)

  Message: Cannot satisfy dependency for service '%s' required by component '%s'.

- Error: 3535 SQLSTATE: HY000 (ER_COMPONENTS_LOAD_CANT_REGISTER_SERVICE_IMPLEMENTATION)

  Message: Cannot register service implementation '%s' provided by component '%s'.

- Error: 3536 SQLSTATE: HY000 (ER_COMPONENTS_LOAD_CANT_INITIALIZE)

Message: Initialization method provided by component '%s' failed.

- Error: 3537 SQLSTATE: HY000 (ER_COMPONENTS_UNLOAD_NOT_LOADED)

  Message: Component specified by URN '%s' to unload has not been loaded before.

- Error: 3538 SQLSTATE: HY000 (ER_COMPONENTS_UNLOAD_CANT_DEINITIALIZE)

  Message: De-initialization method provided by component '%s' failed.

- Error: 3539 SQLSTATE: HY000 (ER_COMPONENTS_CANT_RELEASE_SERVICE)

  Message: Release of previously acquired service implementation failed.

- Error: 3540 SQLSTATE: HY000 (ER_COMPONENTS_UNLOAD_CANT_UNREGISTER_SERVICE)

  Message: Unregistration of service implementation '%s' provided by component '%s' failed during unloading of the component.

- Error: 3541 SQLSTATE: HY000 (ER_COMPONENTS_CANT_UNLOAD)

  Message: Cannot unload component from specified URN: '%s'.

- Error: 3542 SQLSTATE: HY000 (ER_WARN_UNLOAD_THE_NOT_PERSISTED)

  Message: The Persistent Dynamic Loader was used to unload a component '%s', but it was not used to load that component before.

- Error: 3543 SQLSTATE: HY000 (ER_COMPONENT_TABLE_INCORRECT)

  Message: The mysql.component table is missing or has an incorrect definition.

- Error: 3544 SQLSTATE: HY000 (ER_COMPONENT_MANIPULATE_ROW_FAILED)

  Message: Failed to manipulate component '%s' persistence data. Error code %d from storage engine.

- Error: 3545 SQLSTATE: HY000 (ER_COMPONENTS_UNLOAD_DUPLICATE_IN_GROUP)

  Message: The component with specified URN: '%s' was specified in group more than once.

- Error: 3546 SQLSTATE: HY000 (ER_CANT_SET_GTID_PURGED_DUE_SETS_CONSTRAINTS)

  Message: @@GLOBAL.GTID_PURGED cannot be changed: %s

- Error: 3547 SQLSTATE: HY000 (ER_CANNOT_LOCK_USER_MANAGEMENT_CACHES)

  Message: Can not lock user management caches for processing.

- Error: 3548 SQLSTATE: SR001 (ER_SRS_NOT_FOUND)

  Message: There's no spatial reference system with SRID %u.

- Error: 3549 SQLSTATE: HY000 (ER_VARIABLE_NOT_PERSISTED)

  Message: Variables cannot be persisted. Please retry.

- Error: 3550 SQLSTATE: HY000 (ER_IS_QUERY_INVALID_CLAUSE)

  Message: Information schema queries do not support the '%s' clause.

- Error: 3551 SQLSTATE: HY000 (ER_UNABLE_TO_STORE_STATISTICS)

  Message: Unable to store dynamic %s statistics into data dictionary.

- Error: 3552 SQLSTATE: HY000 (ER_NO_SYSTEM_SCHEMA_ACCESS)

  Message: Access to system schema '%s' is rejected.
- Error: 3553 SQLSTATE: HY000 (ER_NO_SYSTEM_TABLESPACE_ACCESS)

  Message: Access to system tablespace '%s' is rejected.
- Error: 3554 SQLSTATE: HY000 (ER_NO_SYSTEM_TABLE_ACCESS)

  Message: Access to %s '%s.%s' is rejected.
- Error: 3555 SQLSTATE: HY000 (ER_NO_SYSTEM_TABLE_ACCESS_FOR_DICTIONARY_TABLE)

  Message: data dictionary table

  ER_NO_SYSTEM_TABLE_ACCESS_FOR_DICTIONARY_TABLE was added in 8.0.1.
- Error: 3556 SQLSTATE: HY000 (ER_NO_SYSTEM_TABLE_ACCESS_FOR_SYSTEM_TABLE)

  Message: system table

  ER_NO_SYSTEM_TABLE_ACCESS_FOR_SYSTEM_TABLE was added in 8.0.1.
- Error: 3557 SQLSTATE: HY000 (ER_NO_SYSTEM_TABLE_ACCESS_FOR_TABLE)

  Message: table

  ER_NO_SYSTEM_TABLE_ACCESS_FOR_TABLE was added in 8.0.1.
- Error: 3558 SQLSTATE: 22023 (ER_INVALID_OPTION_KEY)

  Message: Invalid option key '%s' in function %s.

  ER_INVALID_OPTION_KEY was added in 8.0.1.
- Error: 3559 SQLSTATE: 22023 (ER_INVALID_OPTION_VALUE)

  Message: Invalid value '%s' for option '%s' in function '%s'.

  ER_INVALID_OPTION_VALUE was added in 8.0.1.
- Error: 3560 SQLSTATE: 22023 (ER_INVALID_OPTION_KEY_VALUE_PAIR)

  Message: The string '%s' is not a valid key %c value pair in function %s.

  ER_INVALID_OPTION_KEY_VALUE_PAIR was added in 8.0.1.
- Error: 3561 SQLSTATE: 22023 (ER_INVALID_OPTION_START_CHARACTER)

  Message: The options argument in function %s starts with the invalid character '%c'.

  ER_INVALID_OPTION_START_CHARACTER was added in 8.0.1.
- Error: 3562 SQLSTATE: 22023 (ER_INVALID_OPTION_END_CHARACTER)

  Message: The options argument in function %s ends with the invalid character '%c'.

  ER_INVALID_OPTION_END_CHARACTER was added in 8.0.1.
- Error: 3563 SQLSTATE: 22023 (ER_INVALID_OPTION_CHARACTERS)

  Message: The options argument in function %s contains the invalid character sequence '%s'.

  ER_INVALID_OPTION_CHARACTERS was added in 8.0.1.

- Error: 3564 SQLSTATE: 22023 (ER_DUPLICATE_OPTION_KEY)

  Message: Duplicate option key '%s' in funtion '%s'.

  ER_DUPLICATE_OPTION_KEY was added in 8.0.1.

- Error: 3565 SQLSTATE: 01000 (ER_WARN_SRS_NOT_FOUND_AXIS_ORDER)

  Message: There's no spatial reference system with SRID %u. The axis order is unknown.

  ER_WARN_SRS_NOT_FOUND_AXIS_ORDER was added in 8.0.1.

- Error: 3566 SQLSTATE: HY000 (ER_NO_ACCESS_TO_NATIVE_FCT)

  Message: Access to native function '%s' is rejected.

  ER_NO_ACCESS_TO_NATIVE_FCT was added in 8.0.1.

- Error: 3567 SQLSTATE: HY000 (ER_RESET_MASTER_TO_VALUE_OUT_OF_RANGE)

  Message: The requested value '%lu' for the next binary log index is out of range. Please use a value between '1' and '%lu'.

  ER_RESET_MASTER_TO_VALUE_OUT_OF_RANGE was added in 8.0.1.

- Error: 3568 SQLSTATE: HY000 (ER_UNRESOLVED_TABLE_LOCK)

  Message: Unresolved table name %s in locking clause.

  ER_UNRESOLVED_TABLE_LOCK was added in 8.0.1.

- Error: 3569 SQLSTATE: HY000 (ER_DUPLICATE_TABLE_LOCK)

  Message: Table %s appears in multiple locking clauses.

  ER_DUPLICATE_TABLE_LOCK was added in 8.0.1.

- Error: 3570 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_SKIP_LOCKED)

  Message: Statement is unsafe because it uses SKIP LOCKED. The set of inserted values is non-deterministic.

  ER_BINLOG_UNSAFE_SKIP_LOCKED was added in 8.0.1.

- Error: 3571 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_NOWAIT)

  Message: Statement is unsafe because it uses NOWAIT. Whether the command will succeed or fail is not deterministic.

  ER_BINLOG_UNSAFE_NOWAIT was added in 8.0.1.

- Error: 3572 SQLSTATE: HY000 (ER_LOCK_NOWAIT)

  Message: Statement aborted because lock(s) could not be acquired immediately and NOWAIT is set.

  ER_LOCK_NOWAIT was added in 8.0.1.

- Error: 3573 SQLSTATE: HY000 (ER_CTE_RECURSIVE_REQUIRES_UNION)

  Message: Recursive Common Table Expression '%s' should contain a UNION

  ER_CTE_RECURSIVE_REQUIRES_UNION was added in 8.0.1.

- Error: 3574 SQLSTATE: HY000 (ER_CTE_RECURSIVE_REQUIRES_NONRECURSIVE_FIRST)

Message: Recursive Common Table Expression '%s' should have one or more non-recursive query blocks followed by one or more recursive ones

`ER_CTE_RECURSIVE_REQUIRES_NONRECURSIVE_FIRST` was added in 8.0.1.

- Error: `3575` SQLSTATE: `HY000` (`ER_CTE_RECURSIVE_FORBIDS_AGGREGATION`)

  Message: Recursive Common Table Expression '%s' can contain neither aggregation nor window functions in recursive query block

  `ER_CTE_RECURSIVE_FORBIDS_AGGREGATION` was added in 8.0.1.

- Error: `3576` SQLSTATE: `HY000` (`ER_CTE_RECURSIVE_FORBIDDEN_JOIN_ORDER`)

  Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must neither be in the right argument of a LEFT JOIN, nor be forced to be non-first with join order hints

  `ER_CTE_RECURSIVE_FORBIDDEN_JOIN_ORDER` was added in 8.0.1.

- Error: `3577` SQLSTATE: `HY000` (`ER_CTE_RECURSIVE_REQUIRES_SINGLE_REFERENCE`)

  Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must be referenced only once, and not in any subquery

  `ER_CTE_RECURSIVE_REQUIRES_SINGLE_REFERENCE` was added in 8.0.1.

- Error: `3578` SQLSTATE: `HY000` (`ER_SWITCH_TMP_ENGINE`)

  Message: '%s' requires @@internal_tmp_disk_storage_engine=InnoDB

  `ER_SWITCH_TMP_ENGINE` was added in 8.0.1.

- Error: `3579` SQLSTATE: `HY000` (`ER_WINDOW_NO_SUCH_WINDOW`)

  Message: Window name '%s' is not defined.

  `ER_WINDOW_NO_SUCH_WINDOW` was added in 8.0.2.

- Error: `3580` SQLSTATE: `HY000` (`ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH`)

  Message: There is a circularity in the window dependency graph.

  `ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH` was added in 8.0.2.

- Error: `3581` SQLSTATE: `HY000` (`ER_WINDOW_NO_CHILD_PARTITIONING`)

  Message: A window which depends on another cannot define partitioning.

  `ER_WINDOW_NO_CHILD_PARTITIONING` was added in 8.0.2.

- Error: `3582` SQLSTATE: `HY000` (`ER_WINDOW_NO_INHERIT_FRAME`)

  Message: Window '%s' has a frame definition, so cannot be referenced by another window.

  `ER_WINDOW_NO_INHERIT_FRAME` was added in 8.0.2.

- Error: `3583` SQLSTATE: `HY000` (`ER_WINDOW_NO_REDEFINE_ORDER_BY`)

  Message: Window '%s' cannot inherit '%s' since both contain an ORDER BY clause.

  `ER_WINDOW_NO_REDEFINE_ORDER_BY` was added in 8.0.2.

- Error: 3584 SQLSTATE: HY000 (ER_WINDOW_FRAME_START_ILLEGAL)

  Message: Window '%s': frame start cannot be UNBOUNDED FOLLOWING.

  ER_WINDOW_FRAME_START_ILLEGAL was added in 8.0.2.

- Error: 3585 SQLSTATE: HY000 (ER_WINDOW_FRAME_END_ILLEGAL)

  Message: Window '%s': frame end cannot be UNBOUNDED PRECEDING.

  ER_WINDOW_FRAME_END_ILLEGAL was added in 8.0.2.

- Error: 3586 SQLSTATE: HY000 (ER_WINDOW_FRAME_ILLEGAL)

  Message: Window '%s': frame start or end is negative, NULL or of non-integral type

  ER_WINDOW_FRAME_ILLEGAL was added in 8.0.2.

- Error: 3587 SQLSTATE: HY000 (ER_WINDOW_RANGE_FRAME_ORDER_TYPE)

  Message: Window '%s' with RANGE N PRECEDING/FOLLOWING frame requires exactly one ORDER BY expression, of numeric or temporal type

  ER_WINDOW_RANGE_FRAME_ORDER_TYPE was added in 8.0.2.

- Error: 3588 SQLSTATE: HY000 (ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE)

  Message: Window '%s' with RANGE frame has ORDER BY expression of datetime type. Only INTERVAL bound value allowed.

  ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE was added in 8.0.2.

- Error: 3589 SQLSTATE: HY000 (ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE)

  Message: Window '%s' with RANGE frame has ORDER BY expression of numeric type, INTERVAL bound value not allowed.

  ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE was added in 8.0.2.

- Error: 3590 SQLSTATE: HY000 (ER_WINDOW_RANGE_BOUND_NOT_CONSTANT)

  Message: Window '%s' has a non-constant frame bound.

  ER_WINDOW_RANGE_BOUND_NOT_CONSTANT was added in 8.0.2.

- Error: 3591 SQLSTATE: HY000 (ER_WINDOW_DUPLICATE_NAME)

  Message: Window '%s' is defined twice.

  ER_WINDOW_DUPLICATE_NAME was added in 8.0.2.

- Error: 3592 SQLSTATE: HY000 (ER_WINDOW_ILLEGAL_ORDER_BY)

  Message: Window '%s': ORDER BY or PARTITION BY uses legacy position indication which is not supported, use expression.

  ER_WINDOW_ILLEGAL_ORDER_BY was added in 8.0.2.

- Error: 3593 SQLSTATE: HY000 (ER_WINDOW_INVALID_WINDOW_FUNC_USE)

  Message: You cannot use the window function '%s' in this context.'

  ER_WINDOW_INVALID_WINDOW_FUNC_USE was added in 8.0.2.

- Error: 3594 SQLSTATE: HY000 (ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE)

  Message: You cannot use the alias '%s' of an expression containing a window function in this context.'

  ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE was added in 8.0.2.

- Error: 3595 SQLSTATE: HY000 (ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC)

  Message: You cannot nest a window function in the specification of window '%s'.

  ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC was added in 8.0.2.

- Error: 3596 SQLSTATE: HY000 (ER_WINDOW_ROWS_INTERVAL_USE)

  Message: Window '%s': INTERVAL can only be used with RANGE frames.

  ER_WINDOW_ROWS_INTERVAL_USE was added in 8.0.2.

- Error: 3597 SQLSTATE: HY000 (ER_WINDOW_NO_GROUP_ORDER)

  Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY

  ER_WINDOW_NO_GROUP_ORDER was added in 8.0.2.

- Error: 3598 SQLSTATE: HY000 (ER_WINDOW_EXPLAIN_JSON)

  Message: To get information about window functions use EXPLAIN FORMAT=JSON

  ER_WINDOW_EXPLAIN_JSON was added in 8.0.2.

- Error: 3599 SQLSTATE: HY000 (ER_WINDOW_FUNCTION_IGNORES_FRAME)

  Message: Window function '%s' ignores the frame clause of window '%s' and aggregates over the whole partition

  ER_WINDOW_FUNCTION_IGNORES_FRAME was added in 8.0.2.

- Error: 3600 SQLSTATE: HY000 (ER_WINDOW_SE_NOT_ACCEPTABLE)

  Message: Windowing requires @@internal_tmp_mem_storage_engine=TempTable.

  ER_WINDOW_SE_NOT_ACCEPTABLE was added in 8.0.2.

- Error: 3601 SQLSTATE: HY000 (ER_INVALID_NO_OF_ARGS)

  Message: Too many arguments for function %s: %lu; maximum allowed is %s.

  ER_INVALID_NO_OF_ARGS was added in 8.0.1.

- Error: 3602 SQLSTATE: HY000 (ER_FIELD_IN_GROUPING_NOT_GROUP_BY)

  Message: Argument #%u of GROUPING function is not in GROUP BY

  ER_FIELD_IN_GROUPING_NOT_GROUP_BY was added in 8.0.1.

- Error: 3603 SQLSTATE: HY000 (ER_TOO_LONG_TABLESPACE_COMMENT)

  Message: Comment for tablespace '%s' is too long (max = %lu)

  ER_TOO_LONG_TABLESPACE_COMMENT was added in 8.0.1.

- Error: 3604 SQLSTATE: HY000 (ER_ENGINE_CANT_DROP_TABLE)

Message: Storage engine can't drop table '%s'

ER_ENGINE_CANT_DROP_TABLE was added in 8.0.1.

- Error: 3605 SQLSTATE: HY000 (ER_ENGINE_CANT_DROP_MISSING_TABLE)

  Message: Storage engine can't drop table '%s' because it is missing. Use DROP TABLE IF EXISTS to remove it from data-dictionary.

  ER_ENGINE_CANT_DROP_MISSING_TABLE was added in 8.0.1.

- Error: 3606 SQLSTATE: HY000 (ER_TABLESPACE_DUP_FILENAME)

  Message: Duplicate file name for tablespace '%s'

  ER_TABLESPACE_DUP_FILENAME was added in 8.0.1.

- Error: 3607 SQLSTATE: HY000 (ER_DB_DROP_RMDIR2)

  Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

  ER_DB_DROP_RMDIR2 was added in 8.0.1.

- Error: 3608 SQLSTATE: HY000 (ER_IMP_NO_FILES_MATCHED)

  Message: No SDI files matched the pattern '%s'

  ER_IMP_NO_FILES_MATCHED was added in 8.0.1.

- Error: 3609 SQLSTATE: HY000 (ER_IMP_SCHEMA_DOES_NOT_EXIST)

  Message: Schema '%s', referenced in SDI, does not exist.

  ER_IMP_SCHEMA_DOES_NOT_EXIST was added in 8.0.1.

- Error: 3610 SQLSTATE: HY000 (ER_IMP_TABLE_ALREADY_EXISTS)

  Message: Table '%s.%s', referenced in SDI, already exists.

  ER_IMP_TABLE_ALREADY_EXISTS was added in 8.0.1.

- Error: 3611 SQLSTATE: HY000 (ER_IMP_INCOMPATIBLE_MYSQLD_VERSION)

  Message: Imported mysqld_version (%llu) is not compatible with current (%llu)

  ER_IMP_INCOMPATIBLE_MYSQLD_VERSION was added in 8.0.1.

- Error: 3612 SQLSTATE: HY000 (ER_IMP_INCOMPATIBLE_DD_VERSION)

  Message: Imported dd version (%u) is not compatible with current (%u)

  ER_IMP_INCOMPATIBLE_DD_VERSION was added in 8.0.1.

- Error: 3613 SQLSTATE: HY000 (ER_IMP_INCOMPATIBLE_SDI_VERSION)

  Message: Imported sdi version (%llu) is not compatible with current (%llu)

  ER_IMP_INCOMPATIBLE_SDI_VERSION was added in 8.0.1.

- Error: 3614 SQLSTATE: HY000 (ER_WARN_INVALID_HINT)

  Message: Invalid number of arguments for hint %s

ER_WARN_INVALID_HINT was added in 8.0.1.

- Error: 3615 SQLSTATE: HY000 (ER_VAR_DOES_NOT_EXIST)

  Message: Variable %s does not exist in persisted config file

  ER_VAR_DOES_NOT_EXIST was added in 8.0.1.

- Error: 3616 SQLSTATE: 22S02 (ER_LONGITUDE_OUT_OF_RANGE)

  Message: Longitude %f is out of range in function %s. It must be within (%f, %f].

  ER_LONGITUDE_OUT_OF_RANGE was added in 8.0.1.

- Error: 3617 SQLSTATE: 22S03 (ER_LATITUDE_OUT_OF_RANGE)

  Message: Latitude %f is out of range in function %s. It must be within [%f, %f].

  ER_LATITUDE_OUT_OF_RANGE was added in 8.0.1.

- Error: 3618 SQLSTATE: 22S00 (ER_NOT_IMPLEMENTED_FOR_GEOGRAPHIC_SRS)

  Message: %s(%s, %s) has not been implemented for geographic spatial reference systems.

  ER_NOT_IMPLEMENTED_FOR_GEOGRAPHIC_SRS was added in 8.0.1.

- Error: 3619 SQLSTATE: HY000 (ER_ILLEGAL_PRIVILEGE_LEVEL)

  Message: Illegal privilege level specified for %s

  ER_ILLEGAL_PRIVILEGE_LEVEL was added in 8.0.1.

- Error: 3620 SQLSTATE: HY000 (ER_NO_SYSTEM_VIEW_ACCESS)

  Message: Access to system view INFORMATION_SCHEMA.'%s' is rejected.

  ER_NO_SYSTEM_VIEW_ACCESS was added in 8.0.2.

- Error: 3621 SQLSTATE: XX999 (ER_PARSER_TRACE)

  Message: Parser saw: %s

  ER_PARSER_TRACE was added in 8.0.2.

- Error: 3622 SQLSTATE: HY000 (ER_BOOTSTRAP_CANT_THREAD)

  Message: Can't create thread to handle bootstrap (errno: %d)

  ER_BOOTSTRAP_CANT_THREAD was added in 8.0.2.

- Error: 3623 SQLSTATE: HY000 (ER_COMPONENT_FILTER_FLABBERGASTED)

  Message: The log-filter component "%s" got confused at "%s" ...

  ER_COMPONENT_FILTER_FLABBERGASTED was added in 8.0.2.

- Error: 3624 SQLSTATE: HY000 (ER_TRIGGER_INVALID_VALUE)

  Message: Trigger for table '%s'.'%s': invalid %s value (%s).

  ER_TRIGGER_INVALID_VALUE was added in 8.0.2.

- Error: 3625 SQLSTATE: HY000 (ER_OPT_WRONG_TREE)

Message: Wrong tree: %s

ER_OPT_WRONG_TREE was added in 8.0.2.

- Error: 3626 SQLSTATE: HY000 (ER_DD_FAILSAFE)

  Message: Error: Invalid %s

  ER_DD_FAILSAFE was added in 8.0.2.

- Error: 3627 SQLSTATE: HY000 (ER_DD_INIT_UPGRADE_FAILED)

  Message: Error in initializing dictionary, upgrade will do a cleanup and exit

  ER_DD_INIT_UPGRADE_FAILED was added in 8.0.2.

- Error: 3628 SQLSTATE: HY000 (ER_DD_NO_WRITES_NO_REPOPULATION)

  Message: Skip re-populating collations and character sets tables in %s%sread-only mode.

  ER_DD_NO_WRITES_NO_REPOPULATION was added in 8.0.2.

- Error: 3629 SQLSTATE: HY000 (ER_DD_VERSION_FOUND)

  Message: Found data dictionary with version %d

  ER_DD_VERSION_FOUND was added in 8.0.2.

- Error: 3630 SQLSTATE: HY000 (ER_DD_VERSION_INSTALLED)

  Message: Installed data dictionary with version %d

  ER_DD_VERSION_INSTALLED was added in 8.0.2.

- Error: 3631 SQLSTATE: HY000 (ER_DD_VERSION_UNSUPPORTED)

  Message: Data Dictionary version %d not supported

  ER_DD_VERSION_UNSUPPORTED was added in 8.0.2.

- Error: 3632 SQLSTATE: HY000 (ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION)

  Message: View '%s'.'%s': unknown charset name and/or collation name (client: '%s'; connection: '%s').

  ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION was added in 8.0.2.

- Error: 3633 SQLSTATE: HY000 (ER_DD_VIEW_CANT_ALLOC_CHARSET)

  Message: Error in allocating memory for character set name for view %s.%s.

  ER_DD_VIEW_CANT_ALLOC_CHARSET was added in 8.0.2.

- Error: 3634 SQLSTATE: HY000 (ER_DD_INIT_FAILED)

  Message: Data Dictionary initialization failed.

  ER_DD_INIT_FAILED was added in 8.0.2.

- Error: 3635 SQLSTATE: HY000 (ER_DD_UPDATING_PLUGIN_MD_FAILED)

  Message: Failed to update plugin metadata in dictionary tables.

  ER_DD_UPDATING_PLUGIN_MD_FAILED was added in 8.0.2.

- Error: 3636 SQLSTATE: HY000 (ER_DD_POPULATING_TABLES_FAILED)

  Message: Failed to Populate DD tables.

  ER_DD_POPULATING_TABLES_FAILED was added in 8.0.2.
- Error: 3637 SQLSTATE: HY000 (ER_DD_VIEW_CANT_CREATE)

  Message: Error in Creating View %s.%s

  ER_DD_VIEW_CANT_CREATE was added in 8.0.2.
- Error: 3638 SQLSTATE: HY000 (ER_DD_METADATA_NOT_FOUND)

  Message: Unable to start server. Cannot find the meta data for data dictionary table '%s'.

  ER_DD_METADATA_NOT_FOUND was added in 8.0.2.
- Error: 3639 SQLSTATE: HY000 (ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN)

  Message: Dictionary cache not empty at shutdown.

  ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN was added in 8.0.2.
- Error: 3640 SQLSTATE: HY000 (ER_DD_OBJECT_REMAINS)

  Message: Dictionary objects used but not released.

  ER_DD_OBJECT_REMAINS was added in 8.0.2.
- Error: 3641 SQLSTATE: HY000 (ER_DD_OBJECT_REMAINS_IN_RELEASER)

  Message: Dictionary objects left in default releaser.

  ER_DD_OBJECT_REMAINS_IN_RELEASER was added in 8.0.2.
- Error: 3642 SQLSTATE: HY000 (ER_DD_OBJECT_RELEASER_REMAINS)

  Message: Dictionary object auto releaser not deleted

  ER_DD_OBJECT_RELEASER_REMAINS was added in 8.0.2.
- Error: 3643 SQLSTATE: HY000 (ER_DD_CANT_GET_OBJECT_KEY)

  Message: Error: Unable to create primary object key

  ER_DD_CANT_GET_OBJECT_KEY was added in 8.0.2.
- Error: 3644 SQLSTATE: HY000 (ER_DD_CANT_CREATE_OBJECT_KEY)

  Message: Error: Unable to create object key

  ER_DD_CANT_CREATE_OBJECT_KEY was added in 8.0.2.
- Error: 3645 SQLSTATE: HY000 (ER_LOG_SYSLOG_FACILITY_FAIL)

  Message: Failed to set syslog facility to "%s", setting to "%s" (%d) instead.

  ER_LOG_SYSLOG_FACILITY_FAIL was added in 8.0.2.
- Error: 3646 SQLSTATE: HY000 (ER_LOG_SYSLOG_CANNOT_OPEN)

  Message: Cannot open %s; check privileges, or start server with --log_syslog=0

  ER_LOG_SYSLOG_CANNOT_OPEN was added in 8.0.2.

- Error: 3647 SQLSTATE: HY000 (ER_LOG_FILE_CANNOT_OPEN)

  Message: Could not use %s for logging (error %d - %s). Turning logging off for the server process. To turn it on again: fix the cause, then%s restart the MySQL server.

  ER_LOG_FILE_CANNOT_OPEN was added in 8.0.2.

- Error: 3648 SQLSTATE: HY000 (ER_LOG_SLOW_CANNOT_OPEN)

  Message: either restart the query logging by using "SET GLOBAL SLOW_QUERY_LOG=ON" or

  ER_LOG_SLOW_CANNOT_OPEN was added in 8.0.2.

- Error: 3649 SQLSTATE: HY000 (ER_LOG_GENERAL_CANNOT_OPEN)

  Message: either restart the query logging by using "SET GLOBAL GENERAL_LOG=ON" or

  ER_LOG_GENERAL_CANNOT_OPEN was added in 8.0.2.

- Error: 3650 SQLSTATE: HY000 (ER_LOG_CANNOT_WRITE)

  Message: Failed to write to %s: %s

  ER_LOG_CANNOT_WRITE was added in 8.0.2.

- Error: 3651 SQLSTATE: HY000 (ER_RPL_ZOMBIE_ENCOUNTERED)

  Message: While initializing dump thread for slave with %s <%s>, found a zombie dump thread with the same %s. Master is killing the zombie dump thread(%u).

  ER_RPL_ZOMBIE_ENCOUNTERED was added in 8.0.2.

- Error: 3652 SQLSTATE: HY000 (ER_RPL_GTID_TABLE_CANNOT_OPEN)

  Message: Gtid table is not ready to be used. Table '%s.%s' cannot be opened.

  ER_RPL_GTID_TABLE_CANNOT_OPEN was added in 8.0.2.

- Error: 3653 SQLSTATE: HY000 (ER_SYSTEM_SCHEMA_NOT_FOUND)

  Message: System schema directory does not exist.

  ER_SYSTEM_SCHEMA_NOT_FOUND was added in 8.0.2.

- Error: 3654 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLE_MGR_THREAD)

  Message: Can't create handle_manager thread (errno= %d)

  ER_CANT_CREATE_HANDLE_MGR_THREAD was added in 8.0.2.

- Error: 3655 SQLSTATE: HY000 (ER_RPL_REPO_HAS_GAPS)

  Message: It is not possible to change the type of the relay log's repository because there are workers' repositories with gaps. Please, fix the gaps first before doing such change.

  ER_RPL_REPO_HAS_GAPS was added in 8.0.2.

- Error: 3656 SQLSTATE: HY000 (ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY)

  Message: option 'enforce-gtid-consistency': value '%s' was not recognized. Setting enforce-gtid-consistency to OFF.

  ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY was added in 8.0.2.

- Error: 3657 SQLSTATE: HY000 (ER_CHANGED_ENFORCE_GTID_CONSISTENCY)

  Message: Changed ENFORCE_GTID_CONSISTENCY from %s to %s.

  ER_CHANGED_ENFORCE_GTID_CONSISTENCY was added in 8.0.2.
- Error: 3658 SQLSTATE: HY000 (ER_CHANGED_GTID_MODE)

  Message: Changed GTID_MODE from %s to %s.

  ER_CHANGED_GTID_MODE was added in 8.0.2.
- Error: 3659 SQLSTATE: HY000 (ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT)

  Message: %s is set to a disabled storage engine %s.

  ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT was added in 8.0.2.
- Error: 3660 SQLSTATE: HY000 (ER_DEBUG_SYNC_HIT)

  Message: Debug sync points hit: %s

  ER_DEBUG_SYNC_HIT was added in 8.0.2.
- Error: 3661 SQLSTATE: HY000 (ER_DEBUG_SYNC_EXECUTED)

  Message: Debug sync points executed: %s

  ER_DEBUG_SYNC_EXECUTED was added in 8.0.2.
- Error: 3662 SQLSTATE: HY000 (ER_DEBUG_SYNC_THREAD_MAX)

  Message: Debug sync points max active per thread: %s

  ER_DEBUG_SYNC_THREAD_MAX was added in 8.0.2.
- Error: 3663 SQLSTATE: HY000 (ER_DEBUG_SYNC_OOM)

  Message: Debug Sync Facility disabled due to lack of memory.

  ER_DEBUG_SYNC_OOM was added in 8.0.2.
- Error: 3664 SQLSTATE: HY000 (ER_CANT_INIT_TC_LOG)

  Message: Can't init tc log

  ER_CANT_INIT_TC_LOG was added in 8.0.2.
- Error: 3665 SQLSTATE: HY000 (ER_EVENT_CANT_INIT_QUEUE)

  Message: Event Scheduler: Can't initialize the execution queue

  ER_EVENT_CANT_INIT_QUEUE was added in 8.0.2.
- Error: 3666 SQLSTATE: HY000 (ER_EVENT_PURGING_QUEUE)

  Message: Event Scheduler: Purging the queue. %u events

  ER_EVENT_PURGING_QUEUE was added in 8.0.2.
- Error: 3667 SQLSTATE: HY000 (ER_EVENT_LAST_EXECUTION)

  Message: Event Scheduler: Last execution of %s.%s. %s

  ER_EVENT_LAST_EXECUTION was added in 8.0.2.

- Error: 3668 SQLSTATE: HY000 (ER_EVENT_MESSAGE_STACK)

  Message: %*s

  ER_EVENT_MESSAGE_STACK was added in 8.0.2.

- Error: 3669 SQLSTATE: HY000 (ER_EVENT_EXECUTION_FAILED)

  Message: Event Scheduler: [%s].[%s.%s] event execution failed.

  ER_EVENT_EXECUTION_FAILED was added in 8.0.2.

- Error: 3670 SQLSTATE: HY000 (ER_CANT_INIT_SCHEDULER_THREAD)

  Message: Event Scheduler: Cannot initialize the scheduler thread

  ER_CANT_INIT_SCHEDULER_THREAD was added in 8.0.2.

- Error: 3671 SQLSTATE: HY000 (ER_CANT_CREATE_SCHEDULER_THREAD)

  Message: Event scheduler: Failed to start scheduler, Can not create thread for event scheduler (errno=%d)

  ER_CANT_CREATE_SCHEDULER_THREAD was added in 8.0.2.

- Error: 3672 SQLSTATE: HY000 (ER_SCHEDULER_STOPPED)

  Message: Event Scheduler: Stopped

  ER_SCHEDULER_STOPPED was added in 8.0.2.

- Error: 3673 SQLSTATE: HY000 (ER_SCHEDULER_WAITING)

  Message: Event Scheduler: Waiting for the scheduler thread to reply

  ER_SCHEDULER_WAITING was added in 8.0.2.

- Error: 3674 SQLSTATE: HY000 (ER_SCHEDULER_STARTED)

  Message: Event Scheduler: scheduler thread started with id %u

  ER_SCHEDULER_STARTED was added in 8.0.2.

- Error: 3675 SQLSTATE: HY000 (ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT)

  Message: Event Scheduler: Serious error during getting next event to execute. Stopping

  ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT was added in 8.0.2.

- Error: 3676 SQLSTATE: HY000 (ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER)

  Message: Event_scheduler::execute_top: Can not create event worker thread (errno=%d). Stopping event scheduler

  ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER was added in 8.0.2.

- Error: 3677 SQLSTATE: HY000 (ER_SCHEDULER_KILLING)

  Message: Event Scheduler: Killing the scheduler thread, thread id %u

  ER_SCHEDULER_KILLING was added in 8.0.2.

- Error: 3678 SQLSTATE: HY000 (ER_UNABLE_TO_RESOLVE_IP)

Message: IP address '%s' could not be resolved: %s

ER_UNABLE_TO_RESOLVE_IP was added in 8.0.2.

- Error: 3679 SQLSTATE: HY000 (ER_UNABLE_TO_RESOLVE_HOSTNAME)

  Message: Host name '%s' could not be resolved: %s

  ER_UNABLE_TO_RESOLVE_HOSTNAME was added in 8.0.2.

- Error: 3680 SQLSTATE: HY000 (ER_HOSTNAME_RESEMBLES_IPV4)

  Message: IP address '%s' has been resolved to the host name '%s', which resembles IPv4-address itself.

  ER_HOSTNAME_RESEMBLES_IPV4 was added in 8.0.2.

- Error: 3681 SQLSTATE: HY000 (ER_HOSTNAME_DOESNT_RESOLVE_TO)

  Message: Hostname '%s' does not resolve to '%s'.

  ER_HOSTNAME_DOESNT_RESOLVE_TO was added in 8.0.2.

- Error: 3682 SQLSTATE: HY000 (ER_ADDRESSES_FOR_HOSTNAME_HEADER)

  Message: Hostname '%s' has the following IP addresses:

  ER_ADDRESSES_FOR_HOSTNAME_HEADER was added in 8.0.2.

- Error: 3683 SQLSTATE: HY000 (ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM)

  Message: - %s

  ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM was added in 8.0.2.

- Error: 3684 SQLSTATE: HY000 (ER_TRG_WITHOUT_DEFINER)

  Message: Definer clause is missing in Trigger of Table %s. Rebuild Trigger to fix definer.

  ER_TRG_WITHOUT_DEFINER was added in 8.0.2.

- Error: 3685 SQLSTATE: HY000 (ER_TRG_NO_CLIENT_CHARSET)

  Message: Client character set is missing for trigger of table %s. Using default character set.

  ER_TRG_NO_CLIENT_CHARSET was added in 8.0.2.

- Error: 3686 SQLSTATE: HY000 (ER_PARSING_VIEW)

  Message: Error in parsing view %s.%s

  ER_PARSING_VIEW was added in 8.0.2.

- Error: 3687 SQLSTATE: HY000 (ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP)

  Message: Failed to bootstrap components infrastructure.

  ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP was added in 8.0.2.

- Error: 3688 SQLSTATE: HY000 (ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN)

  Message: Failed to shutdown components infrastructure.

  ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN was added in 8.0.2.

- Error: 3689 SQLSTATE: HY000 (ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP)

  Message: Failed to bootstrap persistent components loader.

  ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP was added in 8.0.2.

- Error: 3690 SQLSTATE: HY000 (ER_DEPART_WITH_GRACE)

  Message: Giving %d client threads a chance to die gracefully

  ER_DEPART_WITH_GRACE was added in 8.0.2.

- Error: 3691 SQLSTATE: HY000 (ER_CA_SELF_SIGNED)

  Message: CA certificate %s is self signed.

  ER_CA_SELF_SIGNED was added in 8.0.2.

- Error: 3692 SQLSTATE: HY000 (ER_SSL_LIBRARY_ERROR)

  Message: Failed to set up SSL because of the following SSL library error: %s

  ER_SSL_LIBRARY_ERROR was added in 8.0.2.

- Error: 3693 SQLSTATE: HY000 (ER_NO_THD_NO_UUID)

  Message: Failed to generate a server UUID because it is failed to allocate the THD.

  ER_NO_THD_NO_UUID was added in 8.0.2.

- Error: 3694 SQLSTATE: HY000 (ER_UUID_SALT)

  Message: Salting uuid generator variables, current_pid: %lu, server_start_time: %lu, bytes_sent: %llu,

  ER_UUID_SALT was added in 8.0.2.

- Error: 3695 SQLSTATE: HY000 (ER_UUID_IS)

  Message: Generated uuid: '%s', server_start_time: %lu, bytes_sent: %llu

  ER_UUID_IS was added in 8.0.2.

- Error: 3696 SQLSTATE: HY000 (ER_UUID_INVALID)

  Message: The server_uuid stored in auto.cnf file is not a valid UUID.

  ER_UUID_INVALID was added in 8.0.2.

- Error: 3697 SQLSTATE: HY000 (ER_UUID_SCRUB)

  Message: Garbage characters found at the end of the server_uuid value in auto.cnf file. It should be of length '%d' (UUID_LENGTH). Clear it and restart the server.

  ER_UUID_SCRUB was added in 8.0.2.

- Error: 3698 SQLSTATE: HY000 (ER_CREATING_NEW_UUID)

  Message: No existing UUID has been found, so we assume that this is the first time that this server has been started. Generating a new UUID: %s.

  ER_CREATING_NEW_UUID was added in 8.0.2.

- Error: 3699 SQLSTATE: HY000 (ER_CANT_CREATE_UUID)

Message: Initialization of the server's UUID failed because it could not be read from the auto.cnf file. If this is a new server, the initialization failed because it was not possible to generate a new UUID.

`ER_CANT_CREATE_UUID` was added in 8.0.2.

- Error: `3700` SQLSTATE: `HY000` (`ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE`)

  Message: Unknown/unsupported storage engine: %s

  `ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE` was added in 8.0.2.

- Error: `3701` SQLSTATE: `HY000` (`ER_SECURE_AUTH_VALUE_UNSUPPORTED`)

  Message: Unsupported value 0 for secure-auth

  `ER_SECURE_AUTH_VALUE_UNSUPPORTED` was added in 8.0.2.

- Error: `3702` SQLSTATE: `HY000` (`ER_INVALID_INSTRUMENT`)

  Message: Invalid instrument name or value for performance_schema_instrument '%s'

  `ER_INVALID_INSTRUMENT` was added in 8.0.2.

- Error: `3703` SQLSTATE: `HY000` (`ER_INNODB_MANDATORY`)

  Message: The use of InnoDB is mandatory since MySQL 5.7. The former options like '--innodb=0/1/OFF/ON' or '--skip-innodb' are ignored.

  `ER_INNODB_MANDATORY` was added in 8.0.2.

- Error: `3704` SQLSTATE: `HY000` (`ER_INNODB_CANNOT_BE_IGNORED`)

  Message: ignore-builtin-innodb is ignored and will be removed in future releases.

  `ER_INNODB_CANNOT_BE_IGNORED` was added in 8.0.2, removed after 8.0.2.

- Error: `3705` SQLSTATE: `HY000` (`ER_OLD_PASSWORDS_NO_MIDDLE_GROUND`)

  Message: Invalid old_passwords mode: 1. Valid values are 2 and 0

  `ER_OLD_PASSWORDS_NO_MIDDLE_GROUND` was added in 8.0.2.

- Error: `3706` SQLSTATE: `HY000` (`ER_VERBOSE_REQUIRES_HELP`)

  Message: --verbose is for use with --help; did you mean --log-error-verbosity?

  `ER_VERBOSE_REQUIRES_HELP` was added in 8.0.2.

- Error: `3707` SQLSTATE: `HY000` (`ER_POINTLESS_WITHOUT_SLOWLOG`)

  Message: options --log-slow-admin-statements, --log-queries-not-using-indexes and --log-slow-slave-statements have no effect if --slow-query-log is not set

  `ER_POINTLESS_WITHOUT_SLOWLOG` was added in 8.0.2.

- Error: `3708` SQLSTATE: `HY000` (`ER_WASTEFUL_NET_BUFFER_SIZE`)

  Message: net_buffer_length (%lu) is set to be larger than max_allowed_packet (%lu). Please rectify.

  `ER_WASTEFUL_NET_BUFFER_SIZE` was added in 8.0.2.

- Error: `3709` SQLSTATE: `HY000` (`ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS`)

Message: TIMESTAMP with implicit DEFAULT value is deprecated. Please use --explicit_defaults_for_timestamp server option (see documentation for more details).

`ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS` was added in 8.0.2.

- Error: `3710` SQLSTATE: `HY000` (`ER_FT_BOOL_SYNTAX_INVALID`)

  Message: Invalid ft-boolean-syntax string: %s

  `ER_FT_BOOL_SYNTAX_INVALID` was added in 8.0.2.

- Error: `3711` SQLSTATE: `HY000` (`ER_CREDENTIALLESS_AUTO_USER_BAD`)

  Message: 'NO_AUTO_CREATE_USER' sql mode was not set.

  `ER_CREDENTIALLESS_AUTO_USER_BAD` was added in 8.0.2.

- Error: `3712` SQLSTATE: `HY000` (`ER_CONNECTION_HANDLING_OOM`)

  Message: Could not allocate memory for connection handling

  `ER_CONNECTION_HANDLING_OOM` was added in 8.0.2.

- Error: `3713` SQLSTATE: `HY000` (`ER_THREAD_HANDLING_OOM`)

  Message: Could not allocate memory for thread handling

  `ER_THREAD_HANDLING_OOM` was added in 8.0.2.

- Error: `3714` SQLSTATE: `HY000` (`ER_CANT_CREATE_TEST_FILE`)

  Message: Can't create test file %s

  `ER_CANT_CREATE_TEST_FILE` was added in 8.0.2.

- Error: `3715` SQLSTATE: `HY000` (`ER_CANT_CREATE_PID_FILE`)

  Message: Can't start server: can't create PID file: %s

  `ER_CANT_CREATE_PID_FILE` was added in 8.0.2.

- Error: `3716` SQLSTATE: `HY000` (`ER_CANT_REMOVE_PID_FILE`)

  Message: Unable to delete pid file: %s

  `ER_CANT_REMOVE_PID_FILE` was added in 8.0.2.

- Error: `3717` SQLSTATE: `HY000` (`ER_CANT_CREATE_SHUTDOWN_THREAD`)

  Message: Can't create thread to handle shutdown requests (errno= %d)

  `ER_CANT_CREATE_SHUTDOWN_THREAD` was added in 8.0.2.

- Error: `3718` SQLSTATE: `HY000` (`ER_SEC_FILE_PRIV_CANT_ACCESS_DIR`)

  Message: Failed to access directory for --secure-file-priv. Please make sure that directory exists and is accessible by MySQL Server. Supplied value : %s

  `ER_SEC_FILE_PRIV_CANT_ACCESS_DIR` was added in 8.0.2.

- Error: `3719` SQLSTATE: `HY000` (`ER_SEC_FILE_PRIV_IGNORED`)

  Message: Ignoring --secure-file-priv value as server is running with --initialize(-insecure).

ER_SEC_FILE_PRIV_IGNORED was added in 8.0.2.

- Error: 3720 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_EMPTY)

  Message: Insecure configuration for --secure-file-priv: Current value does not restrict location of generated files. Consider setting it to a valid, non-empty path.

  ER_SEC_FILE_PRIV_EMPTY was added in 8.0.2.

- Error: 3721 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_NULL)

  Message: --secure-file-priv is set to NULL. Operations related to importing and exporting data are disabled

  ER_SEC_FILE_PRIV_NULL was added in 8.0.2.

- Error: 3722 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_DIRECTORY_INSECURE)

  Message: Insecure configuration for --secure-file-priv: %s is accessible through --secure-file-priv. Consider choosing a different directory.

  ER_SEC_FILE_PRIV_DIRECTORY_INSECURE was added in 8.0.2.

- Error: 3723 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_CANT_STAT)

  Message: Failed to get stat for directory pointed out by --secure-file-priv

  ER_SEC_FILE_PRIV_CANT_STAT was added in 8.0.2.

- Error: 3724 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS)

  Message: Insecure configuration for --secure-file-priv: Location is accessible to all OS users. Consider choosing a different directory.

  ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS was added in 8.0.2.

- Error: 3725 SQLSTATE: HY000 (ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG)

  Message: Value for --secure-file-priv is longer than maximum limit of %d

  ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG was added in 8.0.2.

- Error: 3726 SQLSTATE: HY000 (ER_CANT_CREATE_NAMED_PIPES_THREAD)

  Message: Can't create thread to handle named pipes (errno= %d)

  ER_CANT_CREATE_NAMED_PIPES_THREAD was added in 8.0.2.

- Error: 3727 SQLSTATE: HY000 (ER_CANT_CREATE_TCPIP_THREAD)

  Message: Can't create thread to handle TCP/IP (errno= %d)

  ER_CANT_CREATE_TCPIP_THREAD was added in 8.0.2.

- Error: 3728 SQLSTATE: HY000 (ER_CANT_CREATE_SHM_THREAD)

  Message: Can't create thread to handle shared memory (errno= %d)

  ER_CANT_CREATE_SHM_THREAD was added in 8.0.2.

- Error: 3729 SQLSTATE: HY000 (ER_CANT_CREATE_INTERRUPT_THREAD)

  Message: Can't create interrupt-thread (error %d, errno: %d)

ER_CANT_CREATE_INTERRUPT_THREAD was added in 8.0.2.

- Error: 3730 SQLSTATE: HY000 (ER_WRITABLE_CONFIG_REMOVED)

  Message: World-writable config file '%s' has been removed.

  ER_WRITABLE_CONFIG_REMOVED was added in 8.0.2.

- Error: 3731 SQLSTATE: HY000 (ER_CORE_VALUES)

  Message: setrlimit could not change the size of core files to 'infinity'; We may not be able to generate a core file on signals

  ER_CORE_VALUES was added in 8.0.2.

- Error: 3732 SQLSTATE: HY000 (ER_WRONG_DATETIME_SPEC)

  Message: Wrong date/time format specifier: %s

  ER_WRONG_DATETIME_SPEC was added in 8.0.2.

- Error: 3733 SQLSTATE: HY000 (ER_RPL_BINLOG_FILTERS_OOM)

  Message: Could not allocate replication and binlog filters: %s

  ER_RPL_BINLOG_FILTERS_OOM was added in 8.0.2.

- Error: 3734 SQLSTATE: HY000 (ER_KEYCACHE_OOM)

  Message: Cannot allocate the keycache

  ER_KEYCACHE_OOM was added in 8.0.2.

- Error: 3735 SQLSTATE: HY000 (ER_CONFIRMING_THE_FUTURE)

  Message: Current time has got past year 2038. Validating current time with %d iterations before initiating the normal server shutdown process.

  ER_CONFIRMING_THE_FUTURE was added in 8.0.2.

- Error: 3736 SQLSTATE: HY000 (ER_BACK_IN_TIME)

  Message: Iteration %d: Obtained valid current time from system

  ER_BACK_IN_TIME was added in 8.0.2.

- Error: 3737 SQLSTATE: HY000 (ER_FUTURE_DATE)

  Message: Iteration %d: Current time obtained from system is greater than 2038

  ER_FUTURE_DATE was added in 8.0.2.

- Error: 3738 SQLSTATE: HY000 (ER_UNSUPPORTED_DATE)

  Message: This MySQL server doesn't support dates later then 2038

  ER_UNSUPPORTED_DATE was added in 8.0.2.

- Error: 3739 SQLSTATE: HY000 (ER_STARTING_AS)

  Message: %s (mysqld %s) starting as process %lu ...

  ER_STARTING_AS was added in 8.0.2.

- Error: 3740 SQLSTATE: HY000 (ER_SHUTTING_DOWN_SLAVE_THREADS)

  Message: Shutting down slave threads

  ER_SHUTTING_DOWN_SLAVE_THREADS was added in 8.0.2.

- Error: 3741 SQLSTATE: HY000 (ER_DISCONNECTING_REMAINING_CLIENTS)

  Message: Forcefully disconnecting %d remaining clients

  ER_DISCONNECTING_REMAINING_CLIENTS was added in 8.0.2.

- Error: 3742 SQLSTATE: HY000 (ER_ABORTING)

  Message: Aborting

  ER_ABORTING was added in 8.0.2.

- Error: 3743 SQLSTATE: HY000 (ER_BINLOG_END)

  Message: Binlog end

  ER_BINLOG_END was added in 8.0.2.

- Error: 3744 SQLSTATE: HY000 (ER_CALL_ME_LOCALHOST)

  Message: gethostname failed, using '%s' as hostname

  ER_CALL_ME_LOCALHOST was added in 8.0.2.

- Error: 3745 SQLSTATE: HY000 (ER_USER_REQUIRES_ROOT)

  Message: One can only use the --user switch if running as root

  ER_USER_REQUIRES_ROOT was added in 8.0.2.

- Error: 3746 SQLSTATE: HY000 (ER_REALLY_RUN_AS_ROOT)

  Message: Fatal error: Please read "Security" section of the manual to find out how to run mysqld as root!

  ER_REALLY_RUN_AS_ROOT was added in 8.0.2.

- Error: 3747 SQLSTATE: HY000 (ER_USER_WHAT_USER)

  Message: Fatal error: Can't change to run as user '%s' ; Please check that the user exists!

  ER_USER_WHAT_USER was added in 8.0.2.

- Error: 3748 SQLSTATE: HY000 (ER_TRANSPORTS_WHAT_TRANSPORTS)

  Message: Server is started with --require-secure-transport=ON but no secure transports (SSL or Shared Memory) are configured.

  ER_TRANSPORTS_WHAT_TRANSPORTS was added in 8.0.2.

- Error: 3749 SQLSTATE: HY000 (ER_FAIL_SETGID)

  Message: setgid: %s

  ER_FAIL_SETGID was added in 8.0.2.

- Error: 3750 SQLSTATE: HY000 (ER_FAIL_SETUID)

Message: setuid: %s

ER_FAIL_SETUID was added in 8.0.2.

- Error: 3751 SQLSTATE: HY000 (ER_FAIL_SETREGID)

  Message: setregid: %s

  ER_FAIL_SETREGID was added in 8.0.2.

- Error: 3752 SQLSTATE: HY000 (ER_FAIL_SETREUID)

  Message: setreuid: %s

  ER_FAIL_SETREUID was added in 8.0.2.

- Error: 3753 SQLSTATE: HY000 (ER_FAIL_CHROOT)

  Message: chroot: %s

  ER_FAIL_CHROOT was added in 8.0.2.

- Error: 3754 SQLSTATE: HY000 (ER_WIN_LISTEN_BUT_HOW)

  Message: TCP/IP, --shared-memory, or --named-pipe should be configured on NT OS

  ER_WIN_LISTEN_BUT_HOW was added in 8.0.2.

- Error: 3755 SQLSTATE: HY000 (ER_NOT_RIGHT_NOW)

  Message: CTRL-C ignored during startup

  ER_NOT_RIGHT_NOW was added in 8.0.2.

- Error: 3756 SQLSTATE: HY000 (ER_FIXING_CLIENT_CHARSET)

  Message: '%s' can not be used as client character set. '%s' will be used as default client character set.

  ER_FIXING_CLIENT_CHARSET was added in 8.0.2.

- Error: 3757 SQLSTATE: HY000 (ER_OOM)

  Message: Out of memory

  ER_OOM was added in 8.0.2.

- Error: 3758 SQLSTATE: HY000 (ER_FAILED_TO_LOCK_MEM)

  Message: Failed to lock memory. Errno: %d

  ER_FAILED_TO_LOCK_MEM was added in 8.0.2.

- Error: 3759 SQLSTATE: HY000 (ER_MYINIT_FAILED)

  Message: my_init() failed.

  ER_MYINIT_FAILED was added in 8.0.2.

- Error: 3760 SQLSTATE: HY000 (ER_BEG_INITFILE)

  Message: Execution of init_file \'%s\' started.

  ER_BEG_INITFILE was added in 8.0.2.

- Error: 3761 SQLSTATE: HY000 (ER_END_INITFILE)

  Message: Execution of init_file \'%s\' ended.

  ER_END_INITFILE was added in 8.0.2.
- Error: 3762 SQLSTATE: HY000 (ER_CHANGED_MAX_OPEN_FILES)

  Message: Changed limits: max_open_files: %lu (requested %lu)

  ER_CHANGED_MAX_OPEN_FILES was added in 8.0.2.
- Error: 3763 SQLSTATE: HY000 (ER_CANT_INCREASE_MAX_OPEN_FILES)

  Message: Could not increase number of max_open_files to more than %lu (request: %lu)

  ER_CANT_INCREASE_MAX_OPEN_FILES was added in 8.0.2.
- Error: 3764 SQLSTATE: HY000 (ER_CHANGED_MAX_CONNECTIONS)

  Message: Changed limits: max_connections: %lu (requested %lu)

  ER_CHANGED_MAX_CONNECTIONS was added in 8.0.2.
- Error: 3765 SQLSTATE: HY000 (ER_CHANGED_TABLE_OPEN_CACHE)

  Message: Changed limits: table_open_cache: %lu (requested %lu)

  ER_CHANGED_TABLE_OPEN_CACHE was added in 8.0.2.
- Error: 3766 SQLSTATE: HY000 (ER_THE_USER_ABIDES)

  Message: Ignoring user change to '%s' because the user was set to '%s' earlier on the command line

  ER_THE_USER_ABIDES was added in 8.0.2.
- Error: 3767 SQLSTATE: HY000 (ER_RPL_CANT_ADD_DO_TABLE)

  Message: Could not add do table rule '%s'!

  ER_RPL_CANT_ADD_DO_TABLE was added in 8.0.2.
- Error: 3768 SQLSTATE: HY000 (ER_RPL_CANT_ADD_IGNORE_TABLE)

  Message: Could not add ignore table rule '%s'!

  ER_RPL_CANT_ADD_IGNORE_TABLE was added in 8.0.2.
- Error: 3769 SQLSTATE: HY000 (ER_TRACK_VARIABLES_BOGUS)

  Message: The variable session_track_system_variables either has duplicate values or invalid values.

  ER_TRACK_VARIABLES_BOGUS was added in 8.0.2.
- Error: 3770 SQLSTATE: HY000 (ER_EXCESS_ARGUMENTS)

  Message: Too many arguments (first extra is '%s').

  ER_EXCESS_ARGUMENTS was added in 8.0.2.
- Error: 3771 SQLSTATE: HY000 (ER_VERBOSE_HINT)

  Message: Use --verbose --help to get a list of available options!

  ER_VERBOSE_HINT was added in 8.0.2.

- Error: 3772 SQLSTATE: HY000 (ER_CANT_READ_ERRMSGS)

  Message: Unable to read errmsg.sys file

  ER_CANT_READ_ERRMSGS was added in 8.0.2.

- Error: 3773 SQLSTATE: HY000 (ER_CANT_INIT_DBS)

  Message: Can't init databases

  ER_CANT_INIT_DBS was added in 8.0.2.

- Error: 3774 SQLSTATE: HY000 (ER_LOG_OUTPUT_CONTRADICTORY)

  Message: There were other values specified to log-output besides NONE. Disabling slow and general logs anyway.

  ER_LOG_OUTPUT_CONTRADICTORY was added in 8.0.2.

- Error: 3775 SQLSTATE: HY000 (ER_NO_CSV_NO_LOG_TABLES)

  Message: CSV engine is not present, falling back to the log files

  ER_NO_CSV_NO_LOG_TABLES was added in 8.0.2.

- Error: 3776 SQLSTATE: HY000 (ER_RPL_REWRITEDB_MISSING_ARROW)

  Message: Bad syntax in replicate-rewrite-db - missing '->'!

  ER_RPL_REWRITEDB_MISSING_ARROW was added in 8.0.2.

- Error: 3777 SQLSTATE: HY000 (ER_RPL_REWRITEDB_EMPTY_FROM)

  Message: Bad syntax in replicate-rewrite-db - empty FROM db!

  ER_RPL_REWRITEDB_EMPTY_FROM was added in 8.0.2.

- Error: 3778 SQLSTATE: HY000 (ER_RPL_REWRITEDB_EMPTY_TO)

  Message: Bad syntax in replicate-rewrite-db - empty TO db!

  ER_RPL_REWRITEDB_EMPTY_TO was added in 8.0.2.

- Error: 3779 SQLSTATE: HY000 (ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE)

  Message: Although a path was specified for the %s, log tables are used. To enable logging to files use the --log-output=file option.

  ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE was added in 8.0.2.

- Error: 3780 SQLSTATE: HY000 (ER_LOG_FILE_INVALID)

  Message: Invalid value for %s: %s

  ER_LOG_FILE_INVALID was added in 8.0.2.

- Error: 3781 SQLSTATE: HY000 (ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED)

  Message: The server option 'lower_case_table_names' is configured to use case sensitive table names but the data directory is on a case-insensitive file system which is an unsupported combination. Please consider either using a case sensitive file system for your data directory or switching to a case-insensitive table name mode.

ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED was added in 8.0.2.

- Error: 3782 SQLSTATE: HY000 (ER_LOWER_CASE_TABLE_NAMES_USING_2)

  Message: Setting lower_case_table_names=2 because file system for %s is case insensitive

  ER_LOWER_CASE_TABLE_NAMES_USING_2 was added in 8.0.2.

- Error: 3783 SQLSTATE: HY000 (ER_LOWER_CASE_TABLE_NAMES_USING_0)

  Message: lower_case_table_names was set to 2, even though your the file system '%s' is case sensitive. Now setting lower_case_table_names to 0 to avoid future problems.

  ER_LOWER_CASE_TABLE_NAMES_USING_0 was added in 8.0.2.

- Error: 3784 SQLSTATE: HY000 (ER_NEED_LOG_BIN)

  Message: You need to use --log-bin to make %s work.

  ER_NEED_LOG_BIN was added in 8.0.2.

- Error: 3785 SQLSTATE: HY000 (ER_NEED_FILE_INSTEAD_OF_DIR)

  Message: Path '%s' is a directory name, please specify a file name for %s option

  ER_NEED_FILE_INSTEAD_OF_DIR was added in 8.0.2.

- Error: 3786 SQLSTATE: HY000 (ER_LOG_BIN_BETTER_WITH_NAME)

  Message: No argument was provided to --log-bin, and --log-bin-index was not used; so replication may break when this MySQL server acts as a master and has his hostname changed!! Please use '--log-bin=%s' to avoid this problem.

  ER_LOG_BIN_BETTER_WITH_NAME was added in 8.0.2.

- Error: 3787 SQLSTATE: HY000 (ER_BINLOG_NEEDS_SERVERID)

  Message: You have enabled the binary log, but you haven't provided the mandatory server-id. Please refer to the proper server start-up parameters documentation

  ER_BINLOG_NEEDS_SERVERID was added in 8.0.2.

- Error: 3788 SQLSTATE: HY000 (ER_RPL_CANT_MAKE_PATHS)

  Message: Unable to create replication path names: out of memory or path names too long (path name exceeds %d or file name exceeds %d).

  ER_RPL_CANT_MAKE_PATHS was added in 8.0.2.

- Error: 3789 SQLSTATE: HY000 (ER_CANT_INITIALIZE_GTID)

  Message: Failed to initialize GTID structures.

  ER_CANT_INITIALIZE_GTID was added in 8.0.2.

- Error: 3790 SQLSTATE: HY000 (ER_CANT_INITIALIZE_EARLY_PLUGINS)

  Message: Failed to initialize early plugins.

  ER_CANT_INITIALIZE_EARLY_PLUGINS was added in 8.0.2.

- Error: 3791 SQLSTATE: HY000 (ER_CANT_INITIALIZE_BUILTIN_PLUGINS)

Message: Failed to initialize builtin plugins.

ER_CANT_INITIALIZE_BUILTIN_PLUGINS was added in 8.0.2.

- Error: 3792 SQLSTATE: HY000 (ER_CANT_INITIALIZE_DYNAMIC_PLUGINS)

  Message: Failed to initialize dynamic plugins.

  ER_CANT_INITIALIZE_DYNAMIC_PLUGINS was added in 8.0.2.

- Error: 3793 SQLSTATE: HY000 (ER_PERFSCHEMA_INIT_FAILED)

  Message: Performance schema disabled (reason: init failed).

  ER_PERFSCHEMA_INIT_FAILED was added in 8.0.2.

- Error: 3794 SQLSTATE: HY000 (ER_STACKSIZE_UNEXPECTED)

  Message: Asked for %lu thread stack, but got %ld

  ER_STACKSIZE_UNEXPECTED was added in 8.0.2.

- Error: 3795 SQLSTATE: HY000 (ER_CANT_SET_DATADIR)

  Message: failed to set datadir to %s

  ER_CANT_SET_DATADIR was added in 8.0.2.

- Error: 3796 SQLSTATE: HY000 (ER_CANT_STAT_DATADIR)

  Message: Can't read data directory's stats (%d): %s. Assuming that it's not owned by the same user/group

  ER_CANT_STAT_DATADIR was added in 8.0.2.

- Error: 3797 SQLSTATE: HY000 (ER_CANT_CHOWN_DATADIR)

  Message: Can't change data directory owner to %s

  ER_CANT_CHOWN_DATADIR was added in 8.0.2.

- Error: 3798 SQLSTATE: HY000 (ER_CANT_SET_UP_PERSISTED_VALUES)

  Message: Setting persistent options failed.

  ER_CANT_SET_UP_PERSISTED_VALUES was added in 8.0.2.

- Error: 3799 SQLSTATE: HY000 (ER_CANT_SAVE_GTIDS)

  Message: Failed to save the set of Global Transaction Identifiers of the last binary log into the mysql.gtid_executed table while the server was shutting down. The next server restart will make another attempt to save Global Transaction Identifiers into the table.

  ER_CANT_SAVE_GTIDS was added in 8.0.2.

- Error: 3800 SQLSTATE: HY000 (ER_AUTH_CANT_SET_DEFAULT_PLUGIN)

  Message: Can't start server: Invalid value for --default-authentication-plugin

  ER_AUTH_CANT_SET_DEFAULT_PLUGIN was added in 8.0.2.

- Error: 3801 SQLSTATE: HY000 (ER_CANT_JOIN_SHUTDOWN_THREAD)

Message: Could not join %sthread. error:%d

ER_CANT_JOIN_SHUTDOWN_THREAD was added in 8.0.2.

- Error: 3802 SQLSTATE: HY000 (ER_CANT_HASH_DO_AND_IGNORE_RULES)

  Message: An error occurred while building do_table and ignore_table rules to hashes for global replication filter.

  ER_CANT_HASH_DO_AND_IGNORE_RULES was added in 8.0.2.

- Error: 3803 SQLSTATE: HY000 (ER_CANT_OPEN_CA)

  Message: Error opening CA certificate file

  ER_CANT_OPEN_CA was added in 8.0.2.

- Error: 3804 SQLSTATE: HY000 (ER_CANT_ACCESS_CAPATH)

  Message: Error accessing directory pointed by --ssl-capath

  ER_CANT_ACCESS_CAPATH was added in 8.0.2.

- Error: 3805 SQLSTATE: HY000 (ER_SSL_TRYING_DATADIR_DEFAULTS)

  Message: Found %s, %s and %s in data directory. Trying to enable SSL support using them.

  ER_SSL_TRYING_DATADIR_DEFAULTS was added in 8.0.2.

- Error: 3806 SQLSTATE: HY000 (ER_AUTO_OPTIONS_FAILED)

  Message: Failed to create %s(file: '%s', errno %d)

  ER_AUTO_OPTIONS_FAILED was added in 8.0.2.

- Error: 3807 SQLSTATE: HY000 (ER_CANT_INIT_TIMER)

  Message: Failed to initialize timer component (errno %d).

  ER_CANT_INIT_TIMER was added in 8.0.2.

- Error: 3808 SQLSTATE: HY000 (ER_SERVERID_TOO_LARGE)

  Message: server-id configured is too large to represent with server-id-bits configured.

  ER_SERVERID_TOO_LARGE was added in 8.0.2.

- Error: 3809 SQLSTATE: HY000 (ER_DEFAULT_SE_UNAVAILABLE)

  Message: Default%s storage engine (%s) is not available

  ER_DEFAULT_SE_UNAVAILABLE was added in 8.0.2.

- Error: 3810 SQLSTATE: HY000 (ER_CANT_OPEN_ERROR_LOG)

  Message: Could not open %s file for error logging: %s.

  ER_CANT_OPEN_ERROR_LOG was added in 8.0.2.

- Error: 3811 SQLSTATE: HY000 (ER_INVALID_ERROR_LOG_NAME)

  Message: Invalid log file name after expanding symlinks: '%s'

  ER_INVALID_ERROR_LOG_NAME was added in 8.0.2.

- Error: 3812 SQLSTATE: HY000 (ER_RPL_INFINITY_DENIED)

  Message: using --replicate-same-server-id in conjunction with --log-slave-updates is impossible, it would lead to infinite loops in this server.

  ER_RPL_INFINITY_DENIED was added in 8.0.2.

- Error: 3813 SQLSTATE: HY000 (ER_RPL_INFINITY_IGNORED)

  Message: using --replicate-same-server-id in conjunction with --log-slave-updates would lead to infinite loops in this server. However this will be ignored as the --log-bin option is not defined.

  ER_RPL_INFINITY_IGNORED was added in 8.0.2.

- Error: 3814 SQLSTATE: HY000 (ER_NDB_TABLES_NOT_READY)

  Message: NDB : Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value

  ER_NDB_TABLES_NOT_READY was added in 8.0.2.

- Error: 3815 SQLSTATE: HY000 (ER_TABLE_CHECK_INTACT)

  Message: %s

  ER_TABLE_CHECK_INTACT was added in 8.0.2.

- Error: 3816 SQLSTATE: HY000 (ER_DD_TABLESPACE_NOT_FOUND)

  Message: Unable to start server. The data dictionary tablespace '%s' does not exist.

  ER_DD_TABLESPACE_NOT_FOUND was added in 8.0.2.

- Error: 3817 SQLSTATE: HY000 (ER_DD_TRG_CONNECTION_COLLATION_MISSING)

  Message: Connection collation is missing for trigger of table %s. Using default connection collation.

  ER_DD_TRG_CONNECTION_COLLATION_MISSING was added in 8.0.2.

- Error: 3818 SQLSTATE: HY000 (ER_DD_TRG_DB_COLLATION_MISSING)

  Message: Database collation is missing for trigger of table %s. Using Default character set.

  ER_DD_TRG_DB_COLLATION_MISSING was added in 8.0.2.

- Error: 3819 SQLSTATE: HY000 (ER_DD_TRG_DEFINER_OOM)

  Message: Error in Memory allocation for Definer %s for Trigger.

  ER_DD_TRG_DEFINER_OOM was added in 8.0.2.

- Error: 3820 SQLSTATE: HY000 (ER_DD_TRG_FILE_UNREADABLE)

  Message: Error in reading %s.TRG file.

  ER_DD_TRG_FILE_UNREADABLE was added in 8.0.2.

- Error: 3821 SQLSTATE: HY000 (ER_TRG_CANT_PARSE)

  Message: Error in parsing Triggers from %s.TRG file.

  ER_TRG_CANT_PARSE was added in 8.0.2.

- Error: 3822 SQLSTATE: HY000 (ER_DD_TRG_CANT_ADD)

Message: Error in creating DD entry for Trigger %s.%s

ER_DD_TRG_CANT_ADD was added in 8.0.2.

- Error: 3823 SQLSTATE: HY000 (ER_DD_CANT_RESOLVE_VIEW)

  Message: Resolving dependency for the view '%s.%s' failed. View is no more valid to use

  ER_DD_CANT_RESOLVE_VIEW was added in 8.0.2.

- Error: 3824 SQLSTATE: HY000 (ER_DD_VIEW_WITHOUT_DEFINER)

  Message: %s.%s has no definer (as per an old view format). Current user is used as definer. Please recreate the view.

  ER_DD_VIEW_WITHOUT_DEFINER was added in 8.0.2.

- Error: 3825 SQLSTATE: HY000 (ER_PLUGIN_INIT_FAILED)

  Message: Plugin '%s' init function returned error.

  ER_PLUGIN_INIT_FAILED was added in 8.0.2.

- Error: 3826 SQLSTATE: HY000 (ER_RPL_TRX_DELEGATES_INIT_FAILED)

  Message: Initialization of transaction delegates failed. Please report a bug.

  ER_RPL_TRX_DELEGATES_INIT_FAILED was added in 8.0.2.

- Error: 3827 SQLSTATE: HY000 (ER_RPL_BINLOG_STORAGE_DELEGATES_INIT_FAILED)

  Message: Initialization binlog storage delegates failed. Please report a bug.

  ER_RPL_BINLOG_STORAGE_DELEGATES_INIT_FAILED was added in 8.0.2.

- Error: 3828 SQLSTATE: HY000 (ER_RPL_BINLOG_TRANSMIT_DELEGATES_INIT_FAILED)

  Message: Initialization of binlog transmit delegates failed. Please report a bug.

  ER_RPL_BINLOG_TRANSMIT_DELEGATES_INIT_FAILED was added in 8.0.2.

- Error: 3829 SQLSTATE: HY000 (ER_RPL_BINLOG_RELAY_DELEGATES_INIT_FAILED)

  Message: Initialization binlog relay IO delegates failed. Please report a bug.

  ER_RPL_BINLOG_RELAY_DELEGATES_INIT_FAILED was added in 8.0.2.

- Error: 3830 SQLSTATE: HY000 (ER_RPL_PLUGIN_FUNCTION_FAILED)

  Message: Run function '...' in plugin '%s' failed

  ER_RPL_PLUGIN_FUNCTION_FAILED was added in 8.0.2.

- Error: 3831 SQLSTATE: HY000 (ER_SQL_HA_READ_FAILED)

  Message: mysql_ha_read: Got error %d when reading table '%s'

  ER_SQL_HA_READ_FAILED was added in 8.0.2.

- Error: 3832 SQLSTATE: HY000 (ER_SR_BOGUS_VALUE)

  Message: Stored routine '%s'.'%s': invalid value in column %s.

  ER_SR_BOGUS_VALUE was added in 8.0.2.

- Error: 3833 SQLSTATE: HY000 (ER_SR_INVALID_CONTEXT)

  Message: Invalid creation context '%s.%s'.

  ER_SR_INVALID_CONTEXT was added in 8.0.2.

- Error: 3834 SQLSTATE: HY000 (ER_READING_TABLE_FAILED)

  Message: Got error %d when reading table '%s'

  ER_READING_TABLE_FAILED was added in 8.0.2.

- Error: 3835 SQLSTATE: HY000 (ER_DES_FILE_WRONG_KEY)

  Message: load_des_file: Found wrong key_number: %c

  ER_DES_FILE_WRONG_KEY was added in 8.0.2.

- Error: 3836 SQLSTATE: HY000 (ER_CANT_SET_PERSISTED)

  Message: Failed to set persisted options.

  ER_CANT_SET_PERSISTED was added in 8.0.2.

- Error: 3837 SQLSTATE: HY000 (ER_JSON_PARSE_ERROR)

  Message: JSON parsing error

  ER_JSON_PARSE_ERROR was added in 8.0.2.

- Error: 3838 SQLSTATE: HY000 (ER_CONFIG_OPTION_WITHOUT_GROUP)

  Message: Found option without preceding group in config file

  ER_CONFIG_OPTION_WITHOUT_GROUP was added in 8.0.2.

- Error: 3839 SQLSTATE: HY000 (ER_VALGRIND_DO_QUICK_LEAK_CHECK)

  Message: VALGRIND_DO_QUICK_LEAK_CHECK

  ER_VALGRIND_DO_QUICK_LEAK_CHECK was added in 8.0.2.

- Error: 3840 SQLSTATE: HY000 (ER_VALGRIND_COUNT_LEAKS)

  Message: VALGRIND_COUNT_LEAKS reports %lu leaked bytes for query '%.*s'

  ER_VALGRIND_COUNT_LEAKS was added in 8.0.2.

- Error: 3841 SQLSTATE: HY000 (ER_LOAD_DATA_INFILE_FAILED_IN_UNEXPECTED_WAY)

  Message: LOAD DATA INFILE in the slave SQL Thread can only read from --slave-load-tmpdir. Please, report a bug.

  ER_LOAD_DATA_INFILE_FAILED_IN_UNEXPECTED_WAY was added in 8.0.2.

- Error: 3842 SQLSTATE: HY000 (ER_UNKNOWN_ERROR_NUMBER)

  Message: Got unknown error: %d

  ER_UNKNOWN_ERROR_NUMBER was added in 8.0.2.

- Error: 3843 SQLSTATE: HY000 (ER_UDF_CANT_ALLOC_FOR_STRUCTURES)

  Message: Can't allocate memory for udf structures

ER_UDF_CANT_ALLOC_FOR_STRUCTURES was added in 8.0.2.

- Error: 3844 SQLSTATE: HY000 (ER_UDF_CANT_ALLOC_FOR_FUNCTION)

  Message: Can't alloc memory for udf function: '%s'

  ER_UDF_CANT_ALLOC_FOR_FUNCTION was added in 8.0.2.

- Error: 3845 SQLSTATE: HY000 (ER_UDF_INVALID_ROW_IN_FUNCTION_TABLE)

  Message: Invalid row in mysql.func table for function '%s'

  ER_UDF_INVALID_ROW_IN_FUNCTION_TABLE was added in 8.0.2.

- Error: 3846 SQLSTATE: HY000 (ER_UDF_CANT_OPEN_FUNCTION_TABLE)

  Message: Can't open the mysql.func table. Please run mysql_upgrade to create it.

  ER_UDF_CANT_OPEN_FUNCTION_TABLE was added in 8.0.2.

- Error: 3847 SQLSTATE: HY000 (ER_XA_RECOVER_FOUND_TRX_IN_SE)

  Message: Found %d prepared transaction(s) in %s

  ER_XA_RECOVER_FOUND_TRX_IN_SE was added in 8.0.2.

- Error: 3848 SQLSTATE: HY000 (ER_XA_RECOVER_FOUND_XA_TRX)

  Message: Found %d prepared XA transactions

  ER_XA_RECOVER_FOUND_XA_TRX was added in 8.0.2.

- Error: 3849 SQLSTATE: HY000 (ER_XA_IGNORING_XID)

  Message: ignore xid %s

  ER_XA_IGNORING_XID was added in 8.0.2.

- Error: 3850 SQLSTATE: HY000 (ER_XA_COMMITTING_XID)

  Message: commit xid %s

  ER_XA_COMMITTING_XID was added in 8.0.2.

- Error: 3851 SQLSTATE: HY000 (ER_XA_ROLLING_BACK_XID)

  Message: rollback xid %s

  ER_XA_ROLLING_BACK_XID was added in 8.0.2.

- Error: 3852 SQLSTATE: HY000 (ER_XA_STARTING_RECOVERY)

  Message: Starting crash recovery...

  ER_XA_STARTING_RECOVERY was added in 8.0.2.

- Error: 3853 SQLSTATE: HY000 (ER_XA_NO_MULTI_2PC_HEURISTIC_RECOVER)

  Message: --tc-heuristic-recover rollback strategy is not safe on systems with more than one 2-phase-commit-capable storage engine. Aborting crash recovery.

  ER_XA_NO_MULTI_2PC_HEURISTIC_RECOVER was added in 8.0.2.

- Error: 3854 SQLSTATE: HY000 (ER_XA_RECOVER_EXPLANATION)

Message: Found %d prepared transactions! It means that mysqld was not shut down properly last time and critical recovery information (last binlog or %s file) was manually deleted after a crash. You have to start mysqld with --tc-heuristic-recover switch to commit or rollback pending transactions.

ER_XA_RECOVER_EXPLANATION was added in 8.0.2.

- Error: 3855 SQLSTATE: HY000 (ER_XA_RECOVERY_DONE)

  Message: Crash recovery finished.

  ER_XA_RECOVERY_DONE was added in 8.0.2.

- Error: 3856 SQLSTATE: HY000 (ER_TRX_GTID_COLLECT_REJECT)

  Message: Failed to collect GTID to send in the response packet!

  ER_TRX_GTID_COLLECT_REJECT was added in 8.0.2.

- Error: 3857 SQLSTATE: HY000 (ER_SQL_AUTHOR_DEFAULT_ROLES_FAIL)

  Message: MYSQL.DEFAULT_ROLES couldn't be updated for authorizationidentifier %s

  ER_SQL_AUTHOR_DEFAULT_ROLES_FAIL was added in 8.0.2.

- Error: 3858 SQLSTATE: HY000 (ER_SQL_USER_TABLE_CREATE_WARNING)

  Message: Following users were specified in CREATE USER IF NOT EXISTS but they already exist. Corresponding entry in binary log used default authentication plugin '%s' to rewrite authentication information(if any) for them: %s

  ER_SQL_USER_TABLE_CREATE_WARNING was added in 8.0.2.

- Error: 3859 SQLSTATE: HY000 (ER_SQL_USER_TABLE_ALTER_WARNING)

  Message: Following users were specified in ALTER USER IF EXISTS but they do not exist. Corresponding entry in binary log used default authentication plugin '%s' to rewrite authentication information(if any) for them: %s

  ER_SQL_USER_TABLE_ALTER_WARNING was added in 8.0.2.

- Error: 3860 SQLSTATE: HY000 (ER_ROW_IN_WRONG_PARTITION_PLEASE_REPAIR)

  Message: Table '%s' corrupted: row in wrong partition: %s -- Please REPAIR the table!

  ER_ROW_IN_WRONG_PARTITION_PLEASE_REPAIR was added in 8.0.2.

- Error: 3861 SQLSTATE: HY000 (ER_MYISAM_CRASHED_ERROR_IN_THREAD)

  Message: Got an error from thread_id=%u, %s:%d

  ER_MYISAM_CRASHED_ERROR_IN_THREAD was added in 8.0.2.

- Error: 3862 SQLSTATE: HY000 (ER_MYISAM_CRASHED_ERROR_IN)

  Message: Got an error from unknown thread, %s:%d

  ER_MYISAM_CRASHED_ERROR_IN was added in 8.0.2.

- Error: 3863 SQLSTATE: HY000 (ER_TOO_MANY_STORAGE_ENGINES)

  Message: Too many storage engines!

  ER_TOO_MANY_STORAGE_ENGINES was added in 8.0.2.

- Error: 3864 SQLSTATE: HY000 (ER_SE_TYPECODE_CONFLICT)

  Message: Storage engine '%s' has conflicting typecode. Assigning value %d.

  ER_SE_TYPECODE_CONFLICT was added in 8.0.2.
- Error: 3865 SQLSTATE: HY000 (ER_TRX_WRITE_SET_OOM)

  Message: Out of memory on transaction write set extraction

  ER_TRX_WRITE_SET_OOM was added in 8.0.2.
- Error: 3866 SQLSTATE: HY000 (ER_HANDLERTON_OOM)

  Message: Unable to allocate memory for plugin '%s' handlerton.

  ER_HANDLERTON_OOM was added in 8.0.2.
- Error: 3867 SQLSTATE: HY000 (ER_CONN_SHM_LISTENER)

  Message: Shared memory setting up listener

  ER_CONN_SHM_LISTENER was added in 8.0.2.
- Error: 3868 SQLSTATE: HY000 (ER_CONN_SHM_CANT_CREATE_SERVICE)

  Message: Can't create shared memory service: %s. : %s

  ER_CONN_SHM_CANT_CREATE_SERVICE was added in 8.0.2.
- Error: 3869 SQLSTATE: HY000 (ER_CONN_SHM_CANT_CREATE_CONNECTION)

  Message: Can't create shared memory connection: %s. : %s

  ER_CONN_SHM_CANT_CREATE_CONNECTION was added in 8.0.2.
- Error: 3870 SQLSTATE: HY000 (ER_CONN_PIP_CANT_CREATE_EVENT)

  Message: Can't create event, last error=%u

  ER_CONN_PIP_CANT_CREATE_EVENT was added in 8.0.2.
- Error: 3871 SQLSTATE: HY000 (ER_CONN_PIP_CANT_CREATE_PIPE)

  Message: Can't create new named pipe!: %s

  ER_CONN_PIP_CANT_CREATE_PIPE was added in 8.0.2.
- Error: 3872 SQLSTATE: HY000 (ER_CONN_PER_THREAD_NO_THREAD)

  Message: Can't create thread to handle new connection(errno= %d)

  ER_CONN_PER_THREAD_NO_THREAD was added in 8.0.2.
- Error: 3873 SQLSTATE: HY000 (ER_CONN_TCP_NO_SOCKET)

  Message: Failed to create a socket for %s '%s': errno: %d.

  ER_CONN_TCP_NO_SOCKET was added in 8.0.2.
- Error: 3874 SQLSTATE: HY000 (ER_CONN_TCP_CREATED)

  Message: Server socket created on IP: '%s'.

  ER_CONN_TCP_CREATED was added in 8.0.2.

- Error: 3875 SQLSTATE: HY000 (ER_CONN_TCP_ADDRESS)

  Message: Server hostname (bind-address): '%s'; port: %d

  ER_CONN_TCP_ADDRESS was added in 8.0.2.

- Error: 3876 SQLSTATE: HY000 (ER_CONN_TCP_IPV6_AVAILABLE)

  Message: IPv6 is available.

  ER_CONN_TCP_IPV6_AVAILABLE was added in 8.0.2.

- Error: 3877 SQLSTATE: HY000 (ER_CONN_TCP_IPV6_UNAVAILABLE)

  Message: IPv6 is not available.

  ER_CONN_TCP_IPV6_UNAVAILABLE was added in 8.0.2.

- Error: 3878 SQLSTATE: HY000 (ER_CONN_TCP_ERROR_WITH_STRERROR)

  Message: Can't create IP socket: %s

  ER_CONN_TCP_ERROR_WITH_STRERROR was added in 8.0.2.

- Error: 3879 SQLSTATE: HY000 (ER_CONN_TCP_CANT_RESOLVE_HOSTNAME)

  Message: Can't start server: cannot resolve hostname!

  ER_CONN_TCP_CANT_RESOLVE_HOSTNAME was added in 8.0.2.

- Error: 3880 SQLSTATE: HY000 (ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT)

  Message: Do you already have another mysqld server running on port: %d ?

  ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT was added in 8.0.2.

- Error: 3881 SQLSTATE: HY000 (ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET)

  Message: Do you already have another mysqld server running on socket: %s ?

  ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET was added in 8.0.2.

- Error: 3882 SQLSTATE: HY000 (ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE)

  Message: Another process with pid %d is using unix socket file.

  ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE was added in 8.0.2.

- Error: 3883 SQLSTATE: HY000 (ER_CONN_TCP_CANT_RESET_V6ONLY)

  Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.

  ER_CONN_TCP_CANT_RESET_V6ONLY was added in 8.0.2.

- Error: 3884 SQLSTATE: HY000 (ER_CONN_TCP_BIND_RETRY)

  Message: Retrying bind on TCP/IP port %u

  ER_CONN_TCP_BIND_RETRY was added in 8.0.2.

- Error: 3885 SQLSTATE: HY000 (ER_CONN_TPC_BIND_FAIL)

  Message: Can't start server: Bind on TCP/IP port: %s

ER_CONN_TPC_BIND_FAIL was added in 8.0.2.

- Error: 3886 SQLSTATE: HY000 (ER_CONN_TCP_IP_NOT_LOGGED)

  Message: Fails to print out IP-address.

  ER_CONN_TCP_IP_NOT_LOGGED was added in 8.0.2.

- Error: 3887 SQLSTATE: HY000 (ER_CONN_TCP_RESOLVE_INFO)

  Message: - '%s' resolves to '%s';

  ER_CONN_TCP_RESOLVE_INFO was added in 8.0.2.

- Error: 3888 SQLSTATE: HY000 (ER_CONN_TCP_START_FAIL)

  Message: Can't start server: listen() on TCP/IP port: %s

  ER_CONN_TCP_START_FAIL was added in 8.0.2.

- Error: 3889 SQLSTATE: HY000 (ER_CONN_TCP_LISTEN_FAIL)

  Message: listen() on TCP/IP failed with error %d

  ER_CONN_TCP_LISTEN_FAIL was added in 8.0.2.

- Error: 3890 SQLSTATE: HY000 (ER_CONN_UNIX_PATH_TOO_LONG)

  Message: The socket file path is too long (> %u): %s

  ER_CONN_UNIX_PATH_TOO_LONG was added in 8.0.2.

- Error: 3891 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_FAIL)

  Message: Unable to setup unix socket lock file.

  ER_CONN_UNIX_LOCK_FILE_FAIL was added in 8.0.2.

- Error: 3892 SQLSTATE: HY000 (ER_CONN_UNIX_NO_FD)

  Message: Can't start server: UNIX Socket : %s

  ER_CONN_UNIX_NO_FD was added in 8.0.2.

- Error: 3893 SQLSTATE: HY000 (ER_CONN_UNIX_NO_BIND_NO_START)

  Message: Can't start server : Bind on unix socket: %s

  ER_CONN_UNIX_NO_BIND_NO_START was added in 8.0.2.

- Error: 3894 SQLSTATE: HY000 (ER_CONN_UNIX_LISTEN_FAILED)

  Message: listen() on Unix socket failed with error %d

  ER_CONN_UNIX_LISTEN_FAILED was added in 8.0.2.

- Error: 3895 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_GIVING_UP)

  Message: Unable to create unix socket lock file %s after retries.

  ER_CONN_UNIX_LOCK_FILE_GIVING_UP was added in 8.0.2.

- Error: 3896 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_CREATE)

Message: Could not create unix socket lock file %s.

ER_CONN_UNIX_LOCK_FILE_CANT_CREATE was added in 8.0.2.

- Error: 3897 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_OPEN)

  Message: Could not open unix socket lock file %s.

  ER_CONN_UNIX_LOCK_FILE_CANT_OPEN was added in 8.0.2.

- Error: 3898 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_READ)

  Message: Could not read unix socket lock file %s.

  ER_CONN_UNIX_LOCK_FILE_CANT_READ was added in 8.0.2.

- Error: 3899 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_EMPTY)

  Message: Unix socket lock file is empty %s.

  ER_CONN_UNIX_LOCK_FILE_EMPTY was added in 8.0.2.

- Error: 3900 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_PIDLESS)

  Message: Invalid pid in unix socket lock file %s.

  ER_CONN_UNIX_LOCK_FILE_PIDLESS was added in 8.0.2.

- Error: 3901 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_WRITE)

  Message: Could not write unix socket lock file %s errno %d.

  ER_CONN_UNIX_LOCK_FILE_CANT_WRITE was added in 8.0.2.

- Error: 3902 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_DELETE)

  Message: Could not remove unix socket lock file %s errno %d.

  ER_CONN_UNIX_LOCK_FILE_CANT_DELETE was added in 8.0.2.

- Error: 3903 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_SYNC)

  Message: Could not sync unix socket lock file %s errno %d.

  ER_CONN_UNIX_LOCK_FILE_CANT_SYNC was added in 8.0.2.

- Error: 3904 SQLSTATE: HY000 (ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE)

  Message: Could not close unix socket lock file %s errno %d.

  ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE was added in 8.0.2.

- Error: 3905 SQLSTATE: HY000 (ER_CONN_SOCKET_SELECT_FAILED)

  Message: mysqld: Got error %d from select

  ER_CONN_SOCKET_SELECT_FAILED was added in 8.0.2.

- Error: 3906 SQLSTATE: HY000 (ER_CONN_SOCKET_ACCEPT_FAILED)

  Message: Error in accept: %s

  ER_CONN_SOCKET_ACCEPT_FAILED was added in 8.0.2.

- Error: 3907 SQLSTATE: HY000 (ER_AUTH_RSA_CANT_FIND)

  Message: RSA %s key file not found: %s. Some authentication plugins will not work.

  ER_AUTH_RSA_CANT_FIND was added in 8.0.2.

- Error: 3908 SQLSTATE: HY000 (ER_AUTH_RSA_CANT_PARSE)

  Message: Failure to parse RSA %s key (file exists): %s: %s

  ER_AUTH_RSA_CANT_PARSE was added in 8.0.2.

- Error: 3909 SQLSTATE: HY000 (ER_AUTH_RSA_CANT_READ)

  Message: Failure to read key file: %s

  ER_AUTH_RSA_CANT_READ was added in 8.0.2.

- Error: 3910 SQLSTATE: HY000 (ER_AUTH_RSA_FILES_NOT_FOUND)

  Message: RSA key files not found. Some authentication plugins will not work.

  ER_AUTH_RSA_FILES_NOT_FOUND was added in 8.0.2.

- Error: 3911 SQLSTATE: HY000 (ER_CONN_ATTR_TRUNCATED)

  Message: Connection attributes of length %lu were truncated (%d bytes lost) for connection %llu, user %s@%s (as %s), auth: %s

  ER_CONN_ATTR_TRUNCATED was added in 8.0.2.

- Error: 3912 SQLSTATE: HY000 (ER_X509_CIPHERS_MISMATCH)

  Message: X509 ciphers mismatch: should be '%s' but is '%s'

  ER_X509_CIPHERS_MISMATCH was added in 8.0.2.

- Error: 3913 SQLSTATE: HY000 (ER_X509_ISSUER_MISMATCH)

  Message: X509 issuer mismatch: should be '%s' but is '%s'

  ER_X509_ISSUER_MISMATCH was added in 8.0.2.

- Error: 3914 SQLSTATE: HY000 (ER_X509_SUBJECT_MISMATCH)

  Message: X509 subject mismatch: should be '%s' but is '%s'

  ER_X509_SUBJECT_MISMATCH was added in 8.0.2.

- Error: 3915 SQLSTATE: HY000 (ER_AUTH_CANT_ACTIVATE_ROLE)

  Message: Failed to activate default role %s for %s

  ER_AUTH_CANT_ACTIVATE_ROLE was added in 8.0.2.

- Error: 3916 SQLSTATE: HY000 (ER_X509_NEEDS_RSA_PRIVKEY)

  Message: Could not generate RSA private key required for X509 certificate.

  ER_X509_NEEDS_RSA_PRIVKEY was added in 8.0.2.

- Error: 3917 SQLSTATE: HY000 (ER_X509_CANT_WRITE_KEY)

  Message: Could not write key file: %s

ER_X509_CANT_WRITE_KEY was added in 8.0.2.

- Error: 3918 SQLSTATE: HY000 (ER_X509_CANT_CHMOD_KEY)

  Message: Could not set file permission for %s

  ER_X509_CANT_CHMOD_KEY was added in 8.0.2.

- Error: 3919 SQLSTATE: HY000 (ER_X509_CANT_READ_CA_KEY)

  Message: Could not read CA key file: %s

  ER_X509_CANT_READ_CA_KEY was added in 8.0.2.

- Error: 3920 SQLSTATE: HY000 (ER_X509_CANT_READ_CA_CERT)

  Message: Could not read CA certificate file: %s

  ER_X509_CANT_READ_CA_CERT was added in 8.0.2.

- Error: 3921 SQLSTATE: HY000 (ER_X509_CANT_CREATE_CERT)

  Message: Could not generate X509 certificate.

  ER_X509_CANT_CREATE_CERT was added in 8.0.2.

- Error: 3922 SQLSTATE: HY000 (ER_X509_CANT_WRITE_CERT)

  Message: Could not write certificate file: %s

  ER_X509_CANT_WRITE_CERT was added in 8.0.2.

- Error: 3923 SQLSTATE: HY000 (ER_AUTH_CANT_CREATE_RSA_PAIR)

  Message: Could not generate RSA Private/Public key pair

  ER_AUTH_CANT_CREATE_RSA_PAIR was added in 8.0.2.

- Error: 3924 SQLSTATE: HY000 (ER_AUTH_CANT_WRITE_PRIVKEY)

  Message: Could not write private key file: %s

  ER_AUTH_CANT_WRITE_PRIVKEY was added in 8.0.2.

- Error: 3925 SQLSTATE: HY000 (ER_AUTH_CANT_WRITE_PUBKEY)

  Message: Could not write public key file: %s

  ER_AUTH_CANT_WRITE_PUBKEY was added in 8.0.2.

- Error: 3926 SQLSTATE: HY000 (ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION)

  Message: Skipping generation of SSL certificates as options related to SSL are specified.

  ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION was added in 8.0.2.

- Error: 3927 SQLSTATE: HY000 (ER_AUTH_USING_EXISTING_CERTS)

  Message: Skipping generation of SSL certificates as certificate files are present in data directory.

  ER_AUTH_USING_EXISTING_CERTS was added in 8.0.2.

- Error: 3928 SQLSTATE: HY000 (ER_AUTH_CERTS_SAVED_TO_DATADIR)

Message: Auto generated SSL certificates are placed in data directory.

`ER_AUTH_CERTS_SAVED_TO_DATADIR` was added in 8.0.2.

- Error: `3929` SQLSTATE: `HY000` (`ER_AUTH_CERT_GENERATION_DISABLED`)

  Message: Skipping generation of SSL certificates as --auto_generate_certs is set to OFF.

  `ER_AUTH_CERT_GENERATION_DISABLED` was added in 8.0.2.

- Error: `3930` SQLSTATE: `HY000` (`ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION`)

  Message: Skipping generation of RSA key pair as options related to RSA keys are specified.

  `ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION` was added in 8.0.2.

- Error: `3931` SQLSTATE: `HY000` (`ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT`)

  Message: Skipping generation of RSA key pair as key files are present in data directory.

  `ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT` was added in 8.0.2.

- Error: `3932` SQLSTATE: `HY000` (`ER_AUTH_KEYS_SAVED_TO_DATADIR`)

  Message: Auto generated RSA key files are placed in data directory.

  `ER_AUTH_KEYS_SAVED_TO_DATADIR` was added in 8.0.2.

- Error: `3933` SQLSTATE: `HY000` (`ER_AUTH_KEY_GENERATION_DISABLED`)

  Message: Skipping generation of RSA key pair as --sha256_password_auto_generate_rsa_keys is set to OFF.

  `ER_AUTH_KEY_GENERATION_DISABLED` was added in 8.0.2.

- Error: `3934` SQLSTATE: `HY000` (`ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE`)

  Message: 'proxies_priv' entry '%s@%s %s@%s' ignored in --skip-name-resolve mode.

  `ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE` was added in 8.0.2.

- Error: `3935` SQLSTATE: `HY000` (`ER_AUTHCACHE_PLUGIN_MISSING`)

  Message: The plugin '%.*s' used to authenticate user '%s'@'%.*s' is not loaded. Nobody can currently login using this account.

  `ER_AUTHCACHE_PLUGIN_MISSING` was added in 8.0.2.

- Error: `3936` SQLSTATE: `HY000` (`ER_AUTHCACHE_PLUGIN_CONFIG`)

  Message: The plugin '%s' is used to authenticate user '%s'@'%.*s', %s configured. Nobody can currently login using this account.

  `ER_AUTHCACHE_PLUGIN_CONFIG` was added in 8.0.2.

- Error: `3937` SQLSTATE: `HY000` (`ER_AUTHCACHE_ROLE_TABLES_DODGY`)

  Message: Could not load mysql.role_edges and mysql.default_roles tables. ACL DDLs will not work unless mysql_upgrade is executed.

  `ER_AUTHCACHE_ROLE_TABLES_DODGY` was added in 8.0.2.

- Error: `3938` SQLSTATE: `HY000` (`ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE`)

Message: 'user' entry '%s@%s' ignored in --skip-name-resolve mode.

ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.

- Error: 3939 SQLSTATE: HY000 (ER_AUTHCACHE_USER_TABLE_DODGY)

  Message: Fatal error: mysql.user table is damaged. Please run mysql_upgrade.

  ER_AUTHCACHE_USER_TABLE_DODGY was added in 8.0.2.

- Error: 3940 SQLSTATE: HY000 (ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD)

  Message: User entry '%s'@'%s' has a deprecated pre-4.1 password. The user will be ignored and no one can login with this user anymore.

  ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD was added in 8.0.2.

- Error: 3941 SQLSTATE: HY000 (ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN)

  Message: User entry '%s'@'%s' has an empty plugin value. The user will be ignored and no one can login with this user anymore.

  ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN was added in 8.0.2.

- Error: 3942 SQLSTATE: HY000 (ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD)

  Message: Found invalid password for user: '%s@%s'; Ignoring user

  ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD was added in 8.0.2.

- Error: 3943 SQLSTATE: HY000 (ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED)

  Message: 'user' entry '%s@%s' has the password ignore flag raised, but its authentication plugin doesn't support password expiration. The user id will be ignored.

  ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED was added in 8.0.2.

- Error: 3944 SQLSTATE: HY000 (ER_NO_SUPER_WITHOUT_USER_PLUGIN)

  Message: Some of the user accounts with SUPER privileges were disabled because of empty mysql.user.plugin value. If you are upgrading from MySQL 5.6 to MySQL 5.7 it means we were not able to substitute for empty plugin column. Probably because of pre 4.1 password hash. If your account is disabled you will need to: 1. Stop the server and restart it with --skip-grant-tables. 2. Run mysql_upgrade. 3. Restart the server with the parameters you normally use. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual

  ER_NO_SUPER_WITHOUT_USER_PLUGIN was added in 8.0.2.

- Error: 3945 SQLSTATE: HY000 (ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME)

  Message: Found an entry in the 'db' table with empty database name; Skipped

  ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME was added in 8.0.2.

- Error: 3946 SQLSTATE: HY000 (ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE)

  Message: 'db' entry '%s %s@%s' ignored in --skip-name-resolve mode.

  ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.

- Error: 3947 SQLSTATE: HY000 (ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL)

Message: 'db' entry '%s %s@%s' had database in mixed case that has been forced to lowercase because lower_case_table_names is set. It will not be possible to remove this privilege using REVOKE.

`ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL` was added in 8.0.2.

- Error: `3948` SQLSTATE: `HY000` (`ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING`)

  Message: Missing system table mysql.proxies_priv; please run mysql_upgrade to create it

  `ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING` was added in 8.0.2.

- Error: `3949` SQLSTATE: `HY000` (`ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES`)

  Message: Fatal error: Can't open and lock privilege tables: %s

  `ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES` was added in 8.0.2.

- Error: `3950` SQLSTATE: `HY000` (`ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM`)

  Message: Fatal: can't initialize grant subsystem - '%s'

  `ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM` was added in 8.0.2.

- Error: `3951` SQLSTATE: `HY000` (`ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE`)

  Message: 'procs_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

  `ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE` was added in 8.0.2.

- Error: `3952` SQLSTATE: `HY000` (`ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE`)

  Message: 'procs_priv' entry '%s' ignored, bad routine type

  `ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE` was added in 8.0.2.

- Error: `3953` SQLSTATE: `HY000` (`ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE`)

  Message: 'tables_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

  `ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE` was added in 8.0.2.

- Error: `3954` SQLSTATE: `HY000` (`ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE`)

  Message: Failed to add %s in extra_users. Binary log entry may miss some of the users.

  `ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE` was added in 8.0.2.

- Error: `3955` SQLSTATE: `HY000` (`ER_DD_SCHEMA_NOT_FOUND`)

  Message: Unable to start server. The data dictionary schema '%s' does not exist.

  `ER_DD_SCHEMA_NOT_FOUND` was added in 8.0.2.

- Error: `3956` SQLSTATE: `HY000` (`ER_DD_TABLE_NOT_FOUND`)

  Message: Unable to start server. The data dictionary table '%s' does not exist.

  `ER_DD_TABLE_NOT_FOUND` was added in 8.0.2.

- Error: `3957` SQLSTATE: `HY000` (`ER_DD_SE_INIT_FAILED`)

Message: Failed to initialize DD Storage Engine

ER_DD_SE_INIT_FAILED was added in 8.0.2.

- Error: 3958 SQLSTATE: HY000 (ER_DD_ABORTING_PARTIAL_UPGRADE)

  Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

  ER_DD_ABORTING_PARTIAL_UPGRADE was added in 8.0.2.

- Error: 3959 SQLSTATE: HY000 (ER_DD_FRM_EXISTS_FOR_TABLE)

  Message: Found .frm file with same name as one of the Dictionary Tables.

  ER_DD_FRM_EXISTS_FOR_TABLE was added in 8.0.2.

- Error: 3960 SQLSTATE: HY000 (ER_DD_CREATED_FOR_UPGRADE)

  Message: Created Data Dictionary for upgrade

  ER_DD_CREATED_FOR_UPGRADE was added in 8.0.2.

- Error: 3961 SQLSTATE: HY000 (ER_ERRMSG_CANT_FIND_FILE)

  Message: Can't find error-message file '%s'. Check error-message file location and 'lc-messages-dir' configuration directive.

  ER_ERRMSG_CANT_FIND_FILE was added in 8.0.2.

- Error: 3962 SQLSTATE: HY000 (ER_ERRMSG_LOADING_55_STYLE)

  Message: Using pre 5.5 semantics to load error messages from %s. If this is not intended, refer to the documentation for valid usage of --lc-messages-dir and --language parameters.

  ER_ERRMSG_LOADING_55_STYLE was added in 8.0.2.

- Error: 3963 SQLSTATE: HY000 (ER_ERRMSG_MISSING_IN_FILE)

  Message: Error message file '%s' had only %d error messages, but it should contain at least %d error messages. Check that the above file is the right version for this program!

  ER_ERRMSG_MISSING_IN_FILE was added in 8.0.2.

- Error: 3964 SQLSTATE: HY000 (ER_ERRMSG_OOM)

  Message: Not enough memory for messagefile '%s'

  ER_ERRMSG_OOM was added in 8.0.2.

- Error: 3965 SQLSTATE: HY000 (ER_ERRMSG_CANT_READ)

  Message: Can't read from messagefile '%s'

  ER_ERRMSG_CANT_READ was added in 8.0.2.

- Error: 3966 SQLSTATE: HY000 (ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD)

  Message: Found incompatible DECIMAL field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

  ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD was added in 8.0.2.

- Error: 3967 SQLSTATE: HY000 (ER_TABLE_INCOMPATIBLE_YEAR_FIELD)

  Message: Found incompatible YEAR(x) field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

  ER_TABLE_INCOMPATIBLE_YEAR_FIELD was added in 8.0.2.

- Error: 3968 SQLSTATE: HY000 (ER_INVALID_CHARSET_AND_DEFAULT_IS_MB)

  Message: '%s' had no or invalid character set, and default character set is multi-byte, so character column sizes may have changed

  ER_INVALID_CHARSET_AND_DEFAULT_IS_MB was added in 8.0.2.

- Error: 3969 SQLSTATE: HY000 (ER_TABLE_WRONG_KEY_DEFINITION)

  Message: Found wrong key definition in %s; Please do "ALTER TABLE `%s` FORCE " to fix it!

  ER_TABLE_WRONG_KEY_DEFINITION was added in 8.0.2.

- Error: 3970 SQLSTATE: HY000 (ER_CANT_OPEN_FRM_FILE)

  Message: Unable to open file %s

  ER_CANT_OPEN_FRM_FILE was added in 8.0.2.

- Error: 3971 SQLSTATE: HY000 (ER_CANT_READ_FRM_FILE)

  Message: Error in reading file %s

  ER_CANT_READ_FRM_FILE was added in 8.0.2.

- Error: 3972 SQLSTATE: HY000 (ER_TABLE_CREATED_WITH_DIFFERENT_VERSION)

  Message: Table '%s' was created with a different version of MySQL and cannot be read

  ER_TABLE_CREATED_WITH_DIFFERENT_VERSION was added in 8.0.2.

- Error: 3973 SQLSTATE: HY000 (ER_VIEW_UNPARSABLE)

  Message: Unable to read view %s

  ER_VIEW_UNPARSABLE was added in 8.0.2.

- Error: 3974 SQLSTATE: HY000 (ER_FILE_TYPE_UNKNOWN)

  Message: File %s has unknown type in its header.

  ER_FILE_TYPE_UNKNOWN was added in 8.0.2.

- Error: 3975 SQLSTATE: HY000 (ER_INVALID_INFO_IN_FRM)

  Message: Incorrect information in file %s

  ER_INVALID_INFO_IN_FRM was added in 8.0.2.

- Error: 3976 SQLSTATE: HY000 (ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES)

  Message: Can't open and lock privilege tables: %s

  ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES was added in 8.0.2.

- Error: 3977 SQLSTATE: HY000 (ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS)

Message: Plugin '%s' cannot subscribe to MYSQL_AUDIT_AUTHORIZATION events. Currently not supported.

ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS was added in 8.0.2.

- Error: 3978 SQLSTATE: HY000 (ER_AUDIT_PLUGIN_HAS_INVALID_DATA)

  Message: Plugin '%s' has invalid data.

  ER_AUDIT_PLUGIN_HAS_INVALID_DATA was added in 8.0.2.

- Error: 3979 SQLSTATE: HY000 (ER_TZ_OOM_INITIALIZING_TIME_ZONES)

  Message: Fatal error: OOM while initializing time zones

  ER_TZ_OOM_INITIALIZING_TIME_ZONES was added in 8.0.2.

- Error: 3980 SQLSTATE: HY000 (ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE)

  Message: Can't open and lock time zone table: %s trying to live without them

  ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE was added in 8.0.2.

- Error: 3981 SQLSTATE: HY000 (ER_TZ_OOM_LOADING_LEAP_SECOND_TABLE)

  Message: Fatal error: Out of memory while loading mysql.time_zone_leap_second table

  ER_TZ_OOM_LOADING_LEAP_SECOND_TABLE was added in 8.0.2.

- Error: 3982 SQLSTATE: HY000 (ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE)

  Message: Fatal error: While loading mysql.time_zone_leap_second table: too much leaps

  ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE was added in 8.0.2.

- Error: 3983 SQLSTATE: HY000 (ER_TZ_ERROR_LOADING_LEAP_SECOND_TABLE)

  Message: Fatal error: Error while loading mysql.time_zone_leap_second table

  ER_TZ_ERROR_LOADING_LEAP_SECOND_TABLE was added in 8.0.2.

- Error: 3984 SQLSTATE: HY000 (ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE)

  Message: Fatal error: Illegal or unknown default time zone '%s'

  ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE was added in 8.0.2.

- Error: 3985 SQLSTATE: HY000 (ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE)

  Message: Can't find description of time zone '%.*s'

  ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE was added in 8.0.2.

- Error: 3986 SQLSTATE: HY000 (ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID)

  Message: Can't find description of time zone '%u'

  ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID was added in 8.0.2.

- Error: 3987 SQLSTATE: HY000 (ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE)

  Message: Error while loading time zone description from mysql.time_zone_transition_type table: too big transition type id

ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE was added in 8.0.2.

- Error: 3988 SQLSTATE: HY000 (ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE)

  Message: Error while loading time zone description from mysql.time_zone_transition_type table: not enough room for abbreviations

  ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE was added in 8.0.2.

- Error: 3989 SQLSTATE: HY000 (ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR)

  Message: Error while loading time zone description from mysql.time_zone_transition_type table

  ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR was added in 8.0.2.

- Error: 3990 SQLSTATE: HY000 (ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS)

  Message: Error while loading time zone description from mysql.time_zone_transition table: too much transitions

  ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS was added in 8.0.2.

- Error: 3991 SQLSTATE: HY000 (ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE)

  Message: Error while loading time zone description from mysql.time_zone_transition table: bad transition type id

  ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE was added in 8.0.2.

- Error: 3992 SQLSTATE: HY000 (ER_TZ_TRANSITION_TABLE_LOAD_ERROR)

  Message: Error while loading time zone description from mysql.time_zone_transition table

  ER_TZ_TRANSITION_TABLE_LOAD_ERROR was added in 8.0.2.

- Error: 3993 SQLSTATE: HY000 (ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE)

  Message: loading time zone without transition types

  ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE was added in 8.0.2.

- Error: 3994 SQLSTATE: HY000 (ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION)

  Message: Out of memory while loading time zone description

  ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION was added in 8.0.2.

- Error: 3995 SQLSTATE: HY000 (ER_TZ_CANT_BUILD_MKTIME_MAP)

  Message: Unable to build mktime map for time zone

  ER_TZ_CANT_BUILD_MKTIME_MAP was added in 8.0.2.

- Error: 3996 SQLSTATE: HY000 (ER_TZ_OOM_WHILE_LOADING_TIME_ZONE)

  Message: Out of memory while loading time zone

  ER_TZ_OOM_WHILE_LOADING_TIME_ZONE was added in 8.0.2.

- Error: 3997 SQLSTATE: HY000 (ER_TZ_OOM_WHILE_SETTING_TIME_ZONE)

  Message: Fatal error: Out of memory while setting new time zone

ER_TZ_OOM_WHILE_SETTING_TIME_ZONE was added in 8.0.2.

- Error: 3998 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_CONDITION_BAD)

  Message: Slave SQL thread is stopped because UNTIL condition is bad(%s:%llu).

  ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_CONDITION_BAD was added in 8.0.2.

- Error: 3999 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_POSITION_REACHED)

  Message: Slave SQL thread stopped because it reached its UNTIL position %llu

  ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_POSITION_REACHED was added in 8.0.2.

- Error: 4000 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_ALREADY_APPLIED)

  Message: Slave SQL thread stopped because UNTIL SQL_BEFORE_GTIDS %s is already applied

  ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_ALREADY_APPLIED was added in 8.0.2.

- Error: 4001 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED)

  Message: Slave SQL thread stopped because it reached UNTIL SQL_BEFORE_GTIDS %s

  ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED was added in 8.0.2.

- Error: 4002 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED)

  Message: Slave SQL thread stopped because it reached UNTIL SQL_AFTER_GTIDS %s

  ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED was added in 8.0.2.

- Error: 4003 SQLSTATE: HY000 (ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED)

  Message: Slave SQL thread stopped according to UNTIL SQL_AFTER_MTS_GAPS as it has processed all gap transactions left from the previous slave session.

  ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED was added in 8.0.2.

- Error: 4004 SQLSTATE: HY000 (ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED)

  Message: Group Replication plugin is not installed.

  ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED was added in 8.0.2.

- Error: 4005 SQLSTATE: HY000 (ER_GTID_ALREADY_ADDED_BY_USER)

  Message: The transaction owned GTID is already in the %s table, which is caused by an explicit modifying from user client.

  ER_GTID_ALREADY_ADDED_BY_USER was added in 8.0.2.

- Error: 4006 SQLSTATE: HY000 (ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE)

  Message: Failed to delete the row: '%s' from the gtid_executed table.

  ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE was added in 8.0.2.

- Error: 4007 SQLSTATE: HY000 (ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE)

  Message: Failed to compress the gtid_executed table.

ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE was added in 8.0.2.

- Error: 4008 SQLSTATE: HY000 (ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM)

  Message: Failed to compress the gtid_executed table, because it is failed to allocate the THD.

  ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM was added in 8.0.2.

- Error: 4009 SQLSTATE: HY000 (ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION)

  Message: Failed to initialize thread attribute when creating compression thread.

  ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION was added in 8.0.2.

- Error: 4010 SQLSTATE: HY000 (ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD)

  Message: Can not create thread to compress gtid_executed table (errno= %d)

  ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD was added in 8.0.2.

- Error: 4011 SQLSTATE: HY000 (ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD)

  Message: Could not join gtid_executed table compression thread. error:%d

  ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD was added in 8.0.2.

- Error: 4012 SQLSTATE: HY000 (ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR)

  Message: Can't start server : Initialize security descriptor: %s

  ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR was added in 8.0.2.

- Error: 4013 SQLSTATE: HY000 (ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR)

  Message: Can't start server : Set security descriptor: %s

  ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR was added in 8.0.2.

- Error: 4014 SQLSTATE: HY000 (ER_NPIPE_PIPE_ALREADY_IN_USE)

  Message: Info table is not ready to be used. Table '%s.%s' cannot be scanned.

  ER_RPL_CANT_SCAN_INFO_TABLE was added in 8.0.2.

- Error: 4030 SQLSTATE: HY000 (ER_RPL_CORRUPTED_INFO_TABLE)

  Message: Corrupted table %s.%s. Check out table definition.

  ER_RPL_CORRUPTED_INFO_TABLE was added in 8.0.2.

- Error: 4031 SQLSTATE: HY000 (ER_RPL_CORRUPTED_KEYS_IN_INFO_TABLE)

  Message: Info table has a problem with its key field(s). Table '%s.%s' expected field #%u to be '%s' but found '%s' instead.

  ER_RPL_CORRUPTED_KEYS_IN_INFO_TABLE was added in 8.0.2.

- Error: 4032 SQLSTATE: HY000 (ER_RPL_WORKER_ID_IS)

  Message: Choosing worker id %lu, the following is going to be %lu

  ER_RPL_WORKER_ID_IS was added in 8.0.2.

- Error: 4033 SQLSTATE: HY000 (ER_RPL_INCONSISTENT_TIMESTAMPS_IN_TRX)

  Message: Transaction is tagged with inconsistent logical timestamps: sequence_number (%lld) <= last_committed (%lld)

  ER_RPL_INCONSISTENT_TIMESTAMPS_IN_TRX was added in 8.0.2.

- Error: 4034 SQLSTATE: HY000 (ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX)

  Message: Transaction's sequence number is inconsistent with that of a preceding one: sequence_number (%lld) <= previous sequence_number (%lld)

  ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX was added in 8.0.2.

- Error: 4035 SQLSTATE: HY000 (ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES)

  Message: For the creation of replication channels the master info and relay log info repositories must be set to TABLE

  ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES was added in 8.0.2.

- Error: 4036 SQLSTATE: HY000 (ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID)

  Message: For the creation of replication channels the server id must be different from 0

  ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID was added in 8.0.2.

- Error: 4037 SQLSTATE: HY000 (ER_RPL_REPO_SHOULD_BE_TABLE)

  Message: Slave: Wrong repository. Repository should be TABLE

  ER_RPL_REPO_SHOULD_BE_TABLE was added in 8.0.2.

- Error: 4038 SQLSTATE: HY000 (ER_RPL_ERROR_CREATING_MASTER_INFO)

  Message: Error creating master info: %s.

  ER_RPL_ERROR_CREATING_MASTER_INFO was added in 8.0.2.

- Error: 4039 SQLSTATE: HY000 (ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE)

  Message: Error changing the type of master info's repository: %s.

  ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE was added in 8.0.2.

- Error: 4040 SQLSTATE: HY000 (ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS)

  Message: It is not possible to change the type of the relay log repository because there are workers repositories with possible execution gaps. The value of --relay_log_info_repository is altered to one of the found Worker repositories. The gaps have to be sorted out before resuming with the type change.

  ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS was added in 8.0.2.

- Error: 4041 SQLSTATE: HY000 (ER_RPL_ERROR_CREATING_RELAY_LOG_INFO)

  Message: Error creating relay log info: %s.

  ER_RPL_ERROR_CREATING_RELAY_LOG_INFO was added in 8.0.2.

- Error: 4042 SQLSTATE: HY000 (ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE)

  Message: Error changing the type of relay log info's repository: %s.

  ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE was added in 8.0.2.

- Error: 4043 SQLSTATE: HY000 (ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY)

  Message: Could not delete from Slave Workers info repository.

  ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY was added in 8.0.2.

- Error: 4044 SQLSTATE: HY000 (ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY)

  Message: Could not store the reset Slave Worker state into the slave info repository.

  ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY was added in 8.0.2.

- Error: 4045 SQLSTATE: HY000 (ER_RPL_ERROR_CHECKING_REPOSITORY)

  Message: Error in checking %s repository info type of %s.

  ER_RPL_ERROR_CHECKING_REPOSITORY was added in 8.0.2.

- Error: 4046 SQLSTATE: HY000 (ER_RPL_SLAVE_GENERIC_MESSAGE)

  Message: Slave: %s

ER_RPL_SLAVE_GENERIC_MESSAGE was added in 8.0.2.

- Error: 4047 SQLSTATE: HY000 (ER_RPL_SLAVE_COULD_NOT_CREATE_CHANNEL_LIST)

  Message: Slave: Could not create channel list

  ER_RPL_SLAVE_COULD_NOT_CREATE_CHANNEL_LIST was added in 8.0.2.

- Error: 4048 SQLSTATE: HY000 (ER_RPL_MULTISOURCE_REQUIRES_TABLE_TYPE_REPOSITORIES)

  Message: Slave: This slave was a multisourced slave previously which is supported only by both TABLE based master info and relay log info repositories. Found one or both of the info repos to be type FILE. Set both repos to type TABLE.

  ER_RPL_MULTISOURCE_REQUIRES_TABLE_TYPE_REPOSITORIES was added in 8.0.2.

- Error: 4049 SQLSTATE: HY000 (ER_RPL_SLAVE_FAILED_TO_INIT_A_MASTER_INFO_STRUCTURE)

  Message: Slave: Failed to initialize the master info structure for channel '%s'; its record may still be present in 'mysql.slave_master_info' table, consider deleting it.

  ER_RPL_SLAVE_FAILED_TO_INIT_A_MASTER_INFO_STRUCTURE was added in 8.0.2.

- Error: 4050 SQLSTATE: HY000 (ER_RPL_SLAVE_FAILED_TO_INIT_MASTER_INFO_STRUCTURE)

  Message: Failed to initialize the master info structure%s

  ER_RPL_SLAVE_FAILED_TO_INIT_MASTER_INFO_STRUCTURE was added in 8.0.2.

- Error: 4051 SQLSTATE: HY000 (ER_RPL_SLAVE_FAILED_TO_CREATE_CHANNEL_FROM_MASTER_INFO)

  Message: Slave: Failed to create a channel from master info table repository.

  ER_RPL_SLAVE_FAILED_TO_CREATE_CHANNEL_FROM_MASTER_INFO was added in 8.0.2.

- Error: 4052 SQLSTATE: HY000 (ER_RPL_FAILED_TO_CREATE_NEW_INFO_FILE)

  Message: Failed to create a new info file (file '%s', errno %d)

  ER_RPL_FAILED_TO_CREATE_NEW_INFO_FILE was added in 8.0.2.

- Error: 4053 SQLSTATE: HY000 (ER_RPL_FAILED_TO_CREATE_CACHE_FOR_INFO_FILE)

  Message: Failed to create a cache on info file (file '%s')

  ER_RPL_FAILED_TO_CREATE_CACHE_FOR_INFO_FILE was added in 8.0.2.

- Error: 4054 SQLSTATE: HY000 (ER_RPL_FAILED_TO_OPEN_INFO_FILE)

  Message: Failed to open the existing info file (file '%s', errno %d)

  ER_RPL_FAILED_TO_OPEN_INFO_FILE was added in 8.0.2.

- Error: 4055 SQLSTATE: HY000 (ER_RPL_GTID_MEMORY_FINALLY_AVAILABLE)

  Message: Server overcomes the temporary 'out of memory' in '%d' tries while allocating a new chunk of intervals for storing GTIDs.

  ER_RPL_GTID_MEMORY_FINALLY_AVAILABLE was added in 8.0.2.

- Error: 4056 SQLSTATE: HY000 (ER_SERVER_COST_UNKNOWN_COST_CONSTANT)

  Message: Unknown cost constant "%s" in mysql.server_cost table

  ER_SERVER_COST_UNKNOWN_COST_CONSTANT was added in 8.0.2.

- Error: 4057 SQLSTATE: HY000 (ER_SERVER_COST_INVALID_COST_CONSTANT)

  Message: Invalid value for cost constant "%s" in mysql.server_cost table: %.1f

  ER_SERVER_COST_INVALID_COST_CONSTANT was added in 8.0.2.

- Error: 4058 SQLSTATE: HY000 (ER_ENGINE_COST_UNKNOWN_COST_CONSTANT)

  Message: Unknown cost constant "%s" in mysql.engine_cost table

  ER_ENGINE_COST_UNKNOWN_COST_CONSTANT was added in 8.0.2.

- Error: 4059 SQLSTATE: HY000 (ER_ENGINE_COST_UNKNOWN_STORAGE_ENGINE)

  Message: Unknown storage engine "%s" in mysql.engine_cost table

  ER_ENGINE_COST_UNKNOWN_STORAGE_ENGINE was added in 8.0.2.

- Error: 4060 SQLSTATE: HY000 (ER_ENGINE_COST_INVALID_DEVICE_TYPE_FOR_SE)

  Message: Invalid device type %d for "%s" storage engine for cost constant "%s" in mysql.engine_cost table

  ER_ENGINE_COST_INVALID_DEVICE_TYPE_FOR_SE was added in 8.0.2.

- Error: 4061 SQLSTATE: HY000 (ER_ENGINE_COST_INVALID_CONST_CONSTANT_FOR_SE_AND_DEVICE)

  Message: Invalid value for cost constant "%s" for "%s" storage engine and device type %d in mysql.engine_cost table: %.1f

  ER_ENGINE_COST_INVALID_CONST_CONSTANT_FOR_SE_AND_DEVICE was added in 8.0.2.

- Error: 4062 SQLSTATE: HY000 (ER_SERVER_COST_FAILED_TO_READ)

  Message: init_read_record returned error when reading from mysql.server_cost table.

  ER_SERVER_COST_FAILED_TO_READ was added in 8.0.2.

- Error: 4063 SQLSTATE: HY000 (ER_ENGINE_COST_FAILED_TO_READ)

  Message: init_read_record returned error when reading from mysql.engine_cost table.

  ER_ENGINE_COST_FAILED_TO_READ was added in 8.0.2.

- Error: 4064 SQLSTATE: HY000 (ER_FAILED_TO_OPEN_COST_CONSTANT_TABLES)

  Message: Failed to open optimizer cost constant tables

  ER_FAILED_TO_OPEN_COST_CONSTANT_TABLES was added in 8.0.2.

- Error: 4065 SQLSTATE: HY000 (ER_RPL_UNSUPPORTED_UNIGNORABLE_EVENT_IN_STREAM)

  Message: Unsupported non-ignorable event fed into the event stream.

  ER_RPL_UNSUPPORTED_UNIGNORABLE_EVENT_IN_STREAM was added in 8.0.2.

- Error: 4066 SQLSTATE: HY000 (ER_RPL_GTID_LOG_EVENT_IN_STREAM)

Message: GTID_LOG_EVENT or ANONYMOUS_GTID_LOG_EVENT is not expected in an event stream %s.

`ER_RPL_GTID_LOG_EVENT_IN_STREAM` was added in 8.0.2.

- Error: `4067` SQLSTATE: `HY000` (`ER_RPL_UNEXPECTED_BEGIN_IN_STREAM`)

  Message: QUERY(BEGIN) is not expected in an event stream in the middle of a %s.

  `ER_RPL_UNEXPECTED_BEGIN_IN_STREAM` was added in 8.0.2.

- Error: `4068` SQLSTATE: `HY000` (`ER_RPL_UNEXPECTED_COMMIT_ROLLBACK_OR_XID_LOG_EVENT_IN_STREAM`)

  Message: QUERY(COMMIT or ROLLBACK) or XID_LOG_EVENT is not expected in an event stream %s.

  `ER_RPL_UNEXPECTED_COMMIT_ROLLBACK_OR_XID_LOG_EVENT_IN_STREAM` was added in 8.0.2.

- Error: `4069` SQLSTATE: `HY000` (`ER_RPL_UNEXPECTED_XA_ROLLBACK_IN_STREAM`)

  Message: QUERY(XA ROLLBACK) is not expected in an event stream %s.

  `ER_RPL_UNEXPECTED_XA_ROLLBACK_IN_STREAM` was added in 8.0.2.

- Error: `4070` SQLSTATE: `HY000` (`ER_EVENT_EXECUTION_FAILED_CANT_AUTHENTICATE_USER`)

  Message: Event Scheduler: [%s].[%s.%s] execution failed, failed to authenticate the user.

  `ER_EVENT_EXECUTION_FAILED_CANT_AUTHENTICATE_USER` was added in 8.0.2.

- Error: `4071` SQLSTATE: `HY000` (`ER_EVENT_EXECUTION_FAILED_USER_LOST_EVEN_PRIVILEGE`)

  Message: Event Scheduler: [%s].[%s.%s] execution failed, user no longer has EVENT privilege.

  `ER_EVENT_EXECUTION_FAILED_USER_LOST_EVEN_PRIVILEGE` was added in 8.0.2.

- Error: `4072` SQLSTATE: `HY000` (`ER_EVENT_ERROR_DURING_COMPILATION`)

  Message: Event Scheduler: %serror during compilation of %s.%s

  `ER_EVENT_ERROR_DURING_COMPILATION` was added in 8.0.2.

- Error: `4073` SQLSTATE: `HY000` (`ER_EVENT_DROPPING`)

  Message: Event Scheduler: Dropping %s.%s

  `ER_EVENT_DROPPING` was added in 8.0.2.

- Error: `4074` SQLSTATE: `HY000` (`ER_NDB_SCHEMA_GENERIC_MESSAGE`)

  Message: Ndb schema[%s.%s]: %s

  `ER_NDB_SCHEMA_GENERIC_MESSAGE` was added in 8.0.2.

- Error: `4075` SQLSTATE: `HY000` (`ER_RPL_INCOMPATIBLE_DECIMAL_IN_RBR`)

  Message: In RBR mode, Slave received incompatible DECIMAL field (old-style decimal field) from Master while creating conversion table. Please consider changing datatype on Master to new style decimal by executing ALTER command for column Name: %s.%s.%s.

ER_RPL_INCOMPATIBLE_DECIMAL_IN_RBR was added in 8.0.2.

- Error: 4076 SQLSTATE: HY000 (ER_INIT_ROOT_WITHOUT_PASSWORD)

  Message: root@localhost is created with an empty password ! Please consider switching off the --initialize-insecure option.

  ER_INIT_ROOT_WITHOUT_PASSWORD was added in 8.0.2.

- Error: 4077 SQLSTATE: HY000 (ER_INIT_GENERATING_TEMP_PASSWORD_FOR_ROOT)

  Message: A temporary password is generated for root@localhost: %s

  ER_INIT_GENERATING_TEMP_PASSWORD_FOR_ROOT was added in 8.0.2.

- Error: 4078 SQLSTATE: HY000 (ER_INIT_CANT_OPEN_BOOTSTRAP_FILE)

  Message: Failed to open the bootstrap file %s

  ER_INIT_CANT_OPEN_BOOTSTRAP_FILE was added in 8.0.2.

- Error: 4079 SQLSTATE: HY000 (ER_INIT_BOOTSTRAP_COMPLETE)

  Message: Bootstrapping complete

  ER_INIT_BOOTSTRAP_COMPLETE was added in 8.0.2.

- Error: 4080 SQLSTATE: HY000 (ER_INIT_DATADIR_NOT_EMPTY_WONT_INITIALIZE)

  Message: --initialize specified but the data directory has files in it. Aborting.

  ER_INIT_DATADIR_NOT_EMPTY_WONT_INITIALIZE was added in 8.0.2.

- Error: 4081 SQLSTATE: HY000 (ER_INIT_DATADIR_EXISTS_WONT_INITIALIZE)

  Message: --initialize specified on an existing data directory.

  ER_INIT_DATADIR_EXISTS_WONT_INITIALIZE was added in 8.0.2.

- Error: 4082 SQLSTATE: HY000 (ER_INIT_DATADIR_EXISTS_AND_PATH_TOO_LONG_WONT_INITIALIZE)

  Message: --initialize specified but the data directory exists and the path is too long. Aborting.

  ER_INIT_DATADIR_EXISTS_AND_PATH_TOO_LONG_WONT_INITIALIZE was added in 8.0.2.

- Error: 4083 SQLSTATE: HY000 (ER_INIT_DATADIR_EXISTS_AND_NOT_WRITABLE_WONT_INITIALIZE)

  Message: --initialize specified but the data directory exists and is not writable. Aborting.

  ER_INIT_DATADIR_EXISTS_AND_NOT_WRITABLE_WONT_INITIALIZE was added in 8.0.2.

- Error: 4084 SQLSTATE: HY000 (ER_INIT_CREATING_DD)

  Message: Creating the data directory %s

  ER_INIT_CREATING_DD was added in 8.0.2.

- Error: 4085 SQLSTATE: HY000 (ER_RPL_BINLOG_STARTING_DUMP)

  Message: Start binlog_dump to master_thread_id(%u) slave_server(%u), pos(%s, %llu)

ER_RPL_BINLOG_STARTING_DUMP was added in 8.0.2.

- Error: 4086 SQLSTATE: HY000 (ER_RPL_BINLOG_MASTER_SENDS_HEARTBEAT)

  Message: master sends heartbeat message

  ER_RPL_BINLOG_MASTER_SENDS_HEARTBEAT was added in 8.0.2.

- Error: 4087 SQLSTATE: HY000 (ER_RPL_BINLOG_SKIPPING_REMAINING_HEARTBEAT_INFO)

  Message: the rest of heartbeat info skipped ...

  ER_RPL_BINLOG_SKIPPING_REMAINING_HEARTBEAT_INFO was added in 8.0.2.

- Error: 4088 SQLSTATE: HY000 (ER_RPL_BINLOG_MASTER_USES_CHECKSUM_AND_SLAVE_CANT)

  Message: Master is configured to log replication events with checksum, but will not send such events to slaves that cannot process them

  ER_RPL_BINLOG_MASTER_USES_CHECKSUM_AND_SLAVE_CANT was added in 8.0.2.

- Error: 4089 SQLSTATE: HY000 (ER_NDB_QUERY_FAILED)

  Message: NDB: Query '%s' failed, error: %d: %s

  ER_NDB_QUERY_FAILED was added in 8.0.2.

- Error: 4090 SQLSTATE: HY000 (ER_KILLING_THREAD)

  Message: Killing thread %lu

  ER_KILLING_THREAD was added in 8.0.2.

- Error: 4091 SQLSTATE: HY000 (ER_DETACHING_SESSION_LEFT_BY_PLUGIN)

  Message: Plugin %s is deinitializing a thread but left a session attached. Detaching it forcefully.

  ER_DETACHING_SESSION_LEFT_BY_PLUGIN was added in 8.0.2.

- Error: 4092 SQLSTATE: HY000 (ER_CANT_DETACH_SESSION_LEFT_BY_PLUGIN)

  Message: Failed to detach the session.

  ER_CANT_DETACH_SESSION_LEFT_BY_PLUGIN was added in 8.0.2.

- Error: 4093 SQLSTATE: HY000 (ER_DETACHED_SESSIONS_LEFT_BY_PLUGIN)

  Message: Closed forcefully %u session%s left opened by plugin %s

  ER_DETACHED_SESSIONS_LEFT_BY_PLUGIN was added in 8.0.2.

- Error: 4094 SQLSTATE: HY000 (ER_FAILED_TO_DECREMENT_NUMBER_OF_THREADS)

  Message: Failed to decrement the number of threads

  ER_FAILED_TO_DECREMENT_NUMBER_OF_THREADS was added in 8.0.2.

- Error: 4095 SQLSTATE: HY000 (ER_PLUGIN_DID_NOT_DEINITIALIZE_THREADS)

  Message: Plugin %s did not deinitialize %u threads

  ER_PLUGIN_DID_NOT_DEINITIALIZE_THREADS was added in 8.0.2.

- Error: 4096 SQLSTATE: HY000 (ER_KILLED_THREADS_OF_PLUGIN)

  Message: Killed %u threads of plugin %s

  ER_KILLED_THREADS_OF_PLUGIN was added in 8.0.2.

- Error: 4097 SQLSTATE: HY000 (ER_NDB_SLAVE_MAX_REPLICATED_EPOCH_UNKNOWN)

  Message: NDB Slave : Could not determine maximum replicated epoch from %s.%s at Slave start, error %u %s

  ER_NDB_SLAVE_MAX_REPLICATED_EPOCH_UNKNOWN was added in 8.0.2.

- Error: 4098 SQLSTATE: HY000 (ER_NDB_SLAVE_MAX_REPLICATED_EPOCH_SET_TO)

  Message: NDB Slave : MaxReplicatedEpoch set to %llu (%u/%u) at Slave start

  ER_NDB_SLAVE_MAX_REPLICATED_EPOCH_SET_TO was added in 8.0.2.

- Error: 4099 SQLSTATE: HY000 (ER_NDB_NODE_ID_AND_MANAGEMENT_SERVER_INFO)

  Message: NDB: NodeID is %lu, management server '%s:%lu'

  ER_NDB_NODE_ID_AND_MANAGEMENT_SERVER_INFO was added in 8.0.2.

- Error: 4100 SQLSTATE: HY000 (ER_NDB_DISCONNECT_INFO)

  Message: tid %u: node[%u] transaction_hint=%u, transaction_no_hint=%u

  ER_NDB_DISCONNECT_INFO was added in 8.0.2.

- Error: 4101 SQLSTATE: HY000 (ER_NDB_COLUMN_DEFAULTS_DIFFER)

  Message: NDB Internal error: Default values differ for column %u, ndb_default: %d

  ER_NDB_COLUMN_DEFAULTS_DIFFER was added in 8.0.2.

- Error: 4102 SQLSTATE: HY000 (ER_NDB_COLUMN_SHOULD_NOT_HAVE_NATIVE_DEFAULT)

  Message: NDB Internal error: Column %u has native default, but shouldn't. Flags=%u, type=%u

  ER_NDB_COLUMN_SHOULD_NOT_HAVE_NATIVE_DEFAULT was added in 8.0.2.

- Error: 4103 SQLSTATE: HY000 (ER_NDB_FIELD_INFO)

  Message: field[name: '%s', type: %u, real_type: %u, flags: 0x%x, is_null: %d]

  ER_NDB_FIELD_INFO was added in 8.0.2.

- Error: 4104 SQLSTATE: HY000 (ER_NDB_COLUMN_INFO)

  Message: ndbCol[name: '%s', type: %u, column_no: %d, nullable: %d]

  ER_NDB_COLUMN_INFO was added in 8.0.2.

- Error: 4105 SQLSTATE: HY000 (ER_NDB_OOM_IN_FIX_UNIQUE_INDEX_ATTR_ORDER)

  Message: fix_unique_index_attr_order: my_malloc(%u) failure

  ER_NDB_OOM_IN_FIX_UNIQUE_INDEX_ATTR_ORDER was added in 8.0.2.

- Error: 4106 SQLSTATE: HY000 (ER_NDB_SLAVE_MALFORMED_EVENT_RECEIVED_ON_TABLE)

  Message: NDB Slave : Malformed event received on table %s cannot parse. Stopping Slave.

ER_NDB_SLAVE_MALFORMED_EVENT_RECEIVED_ON_TABLE was added in 8.0.2.

- Error: 4107 SQLSTATE: HY000 (ER_NDB_SLAVE_CONFLICT_FUNCTION_REQUIRES_ROLE)

  Message: NDB Slave : Conflict function %s defined on table %s requires ndb_slave_conflict_role variable to be set. Stopping slave.

  ER_NDB_SLAVE_CONFLICT_FUNCTION_REQUIRES_ROLE was added in 8.0.2.

- Error: 4108 SQLSTATE: HY000 (ER_NDB_SLAVE_CONFLICT_DETECTION_REQUIRES_TRANSACTION_IDS)

  Message: NDB Slave : Transactional conflict detection defined on table %s, but events received without transaction ids. Check --ndb-log-transaction-id setting on upstream Cluster.

  ER_NDB_SLAVE_CONFLICT_DETECTION_REQUIRES_TRANSACTION_IDS was added in 8.0.2.

- Error: 4109 SQLSTATE: HY000 (ER_NDB_SLAVE_BINLOG_MISSING_INFO_FOR_CONFLICT_DETECTION)

  Message: NDB Slave : Binlog event on table %s missing info necessary for conflict detection. Check binlog format options on upstream cluster.

  ER_NDB_SLAVE_BINLOG_MISSING_INFO_FOR_CONFLICT_DETECTION was added in 8.0.2.

- Error: 4110 SQLSTATE: HY000 (ER_NDB_ERROR_IN_READAUTOINCREMENTVALUE)

  Message: Error %lu in readAutoIncrementValue(): %s

  ER_NDB_ERROR_IN_READAUTOINCREMENTVALUE was added in 8.0.2.

- Error: 4111 SQLSTATE: HY000 (ER_NDB_FOUND_UNCOMMITTED_AUTOCOMMIT)

  Message: found uncommitted autocommit+rbwr transaction, commit status: %d

  ER_NDB_FOUND_UNCOMMITTED_AUTOCOMMIT was added in 8.0.2.

- Error: 4112 SQLSTATE: HY000 (ER_NDB_SLAVE_TOO_MANY_RETRIES)

  Message: Ndb slave retried transaction %u time(s) in vain. Giving up.

  ER_NDB_SLAVE_TOO_MANY_RETRIES was added in 8.0.2.

- Error: 4113 SQLSTATE: HY000 (ER_NDB_SLAVE_ERROR_IN_UPDATE_CREATE_INFO)

  Message: Error %lu in ::update_create_info(): %s

  ER_NDB_SLAVE_ERROR_IN_UPDATE_CREATE_INFO was added in 8.0.2.

- Error: 4114 SQLSTATE: HY000 (ER_NDB_SLAVE_CANT_ALLOCATE_TABLE_SHARE)

  Message: NDB: allocating table share for %s failed

  ER_NDB_SLAVE_CANT_ALLOCATE_TABLE_SHARE was added in 8.0.2.

- Error: 4115 SQLSTATE: HY000 (ER_NDB_BINLOG_ERROR_INFO_FROM_DA)

  ER_NDB_INITIALIZE_GIVEN_CLUSTER_PLUGIN_DISABLED was added in 8.0.2.

- Error: 4125 SQLSTATE: HY000 (ER_NDB_BINLOG_FORMAT_CHANGED_FROM_STMT_TO_MIXED)

  Message: NDB: Changed global value of binlog_format from STATEMENT to MIXED

  ER_NDB_BINLOG_FORMAT_CHANGED_FROM_STMT_TO_MIXED was added in 8.0.2.

- Error: 4126 SQLSTATE: HY000 (ER_NDB_TRAILING_SHARE_RELEASED_BY_CLOSE_CACHED_TABLES)

Message: NDB_SHARE: trailing share %s, released by close_cached_tables

ER_NDB_TRAILING_SHARE_RELEASED_BY_CLOSE_CACHED_TABLES was added in 8.0.2.

- Error: 4127 SQLSTATE: HY000 (ER_NDB_SHARE_ALREADY_EXISTS)

  Message: NDB_SHARE: %s already exists use_count=%d. Moving away for safety, but possible memleak.

  ER_NDB_SHARE_ALREADY_EXISTS was added in 8.0.2.

- Error: 4128 SQLSTATE: HY000 (ER_NDB_HANDLE_TRAILING_SHARE_INFO)

  Message: handle_trailing_share: %s use_count: %u

  ER_NDB_HANDLE_TRAILING_SHARE_INFO was added in 8.0.2.

- Error: 4129 SQLSTATE: HY000 (ER_NDB_CLUSTER_GET_SHARE_INFO)

  Message: ndbcluster_get_share: %s use_count: %u

  ER_NDB_CLUSTER_GET_SHARE_INFO was added in 8.0.2.

- Error: 4130 SQLSTATE: HY000 (ER_NDB_CLUSTER_REAL_FREE_SHARE_INFO)

  Message: ndbcluster_real_free_share: %s use_count: %u

  ER_NDB_CLUSTER_REAL_FREE_SHARE_INFO was added in 8.0.2.

- Error: 4131 SQLSTATE: HY000 (ER_NDB_CLUSTER_REAL_FREE_SHARE_DROP_FAILED)

  Message: ndbcluster_real_free_share: %s, still open - ignored 'free' (leaked?)

  ER_NDB_CLUSTER_REAL_FREE_SHARE_DROP_FAILED was added in 8.0.2.

- Error: 4132 SQLSTATE: HY000 (ER_NDB_CLUSTER_FREE_SHARE_INFO)

  Message: ndbcluster_free_share: %s use_count: %u

  ER_NDB_CLUSTER_FREE_SHARE_INFO was added in 8.0.2.

- Error: 4133 SQLSTATE: HY000 (ER_NDB_CLUSTER_MARK_SHARE_DROPPED_INFO)

  Message: ndbcluster_mark_share_dropped: %s use_count: %u

  ER_NDB_CLUSTER_MARK_SHARE_DROPPED_INFO was added in 8.0.2.

- Error: 4134 SQLSTATE: HY000 (ER_NDB_CLUSTER_MARK_SHARE_DROPPED_DESTROYING_SHARE)

  Message: ndbcluster_mark_share_dropped: destroys share %s

  ER_NDB_CLUSTER_MARK_SHARE_DROPPED_DESTROYING_SHARE was added in 8.0.2.

- Error: 4135 SQLSTATE: HY000 (ER_NDB_CLUSTER_OOM_THD_NDB)

  Message: Could not allocate Thd_ndb object

  ER_NDB_CLUSTER_OOM_THD_NDB was added in 8.0.2.

- Error: 4136 SQLSTATE: HY000 (ER_NDB_BINLOG_NDB_TABLES_INITIALLY_READ_ONLY)

  Message: NDB Binlog: Ndb tables initially read only.

ER_NDB_BINLOG_NDB_TABLES_INITIALLY_READ_ONLY was added in 8.0.2.

- Error: 4137 SQLSTATE: HY000 (ER_NDB_UTIL_THREAD_OOM)

  Message: ndb util thread: malloc failure, query cache not maintained properly

  ER_NDB_UTIL_THREAD_OOM was added in 8.0.2.

- Error: 4138 SQLSTATE: HY000 (ER_NDB_ILLEGAL_VALUE_FOR_NDB_RECV_THREAD_CPU_MASK)

  Message: Trying to set ndb_recv_thread_cpu_mask to illegal value = %s, ignored

  ER_NDB_ILLEGAL_VALUE_FOR_NDB_RECV_THREAD_CPU_MASK was added in 8.0.2.

- Error: 4139 SQLSTATE: HY000 (ER_NDB_TOO_MANY_CPUS_IN_NDB_RECV_THREAD_CPU_MASK)

  Message: Trying to set too many CPU's in ndb_recv_thread_cpu_mask, ignored this variable, erroneus value = %s

  ER_NDB_TOO_MANY_CPUS_IN_NDB_RECV_THREAD_CPU_MASK was added in 8.0.2.

- Error: 4140 SQLSTATE: HY000 (ER_DBUG_CHECK_SHARES_OPEN)

  Message: dbug_check_shares open:

  ER_DBUG_CHECK_SHARES_OPEN was added in 8.0.2.

- Error: 4141 SQLSTATE: HY000 (ER_DBUG_CHECK_SHARES_INFO)

  Message: %s.%s: state: %s(%u) use_count: %u

  ER_DBUG_CHECK_SHARES_INFO was added in 8.0.2.

- Error: 4142 SQLSTATE: HY000 (ER_DBUG_CHECK_SHARES_DROPPED)

  Message: dbug_check_shares dropped:

  ER_DBUG_CHECK_SHARES_DROPPED was added in 8.0.2.

- Error: 4143 SQLSTATE: HY000 (ER_INVALID_OR_OLD_TABLE_OR_DB_NAME)

  Message: Invalid (old?) table or database name '%s'

  ER_INVALID_OR_OLD_TABLE_OR_DB_NAME was added in 8.0.2.

- Error: 4144 SQLSTATE: HY000 (ER_TC_RECOVERING_AFTER_CRASH_USING)

  Message: Recovering after a crash using %s

  ER_TC_RECOVERING_AFTER_CRASH_USING was added in 8.0.2.

- Error: 4145 SQLSTATE: HY000 (ER_TC_CANT_AUTO_RECOVER_WITH_TC_HEURISTIC_RECOVER)

  Message: Cannot perform automatic crash recovery when --tc-heuristic-recover is used

  ER_TC_CANT_AUTO_RECOVER_WITH_TC_HEURISTIC_RECOVER was added in 8.0.2.

- Error: 4146 SQLSTATE: HY000 (ER_TC_BAD_MAGIC_IN_TC_LOG)

  Message: Bad magic header in tc log

ER_TC_BAD_MAGIC_IN_TC_LOG was added in 8.0.2.

- Error: 4147 SQLSTATE: HY000 (ER_TC_NEED_N_SE_SUPPORTING_2PC_FOR_RECOVERY)

  Message: Recovery failed! You must enable exactly %d storage engines that support two-phase commit protocol

  ER_TC_NEED_N_SE_SUPPORTING_2PC_FOR_RECOVERY was added in 8.0.2.

- Error: 4148 SQLSTATE: HY000 (ER_TC_RECOVERY_FAILED_THESE_ARE_YOUR_OPTIONS)

  Message: Crash recovery failed. Either correct the problem (if it's, for example, out of memory error) and restart, or delete tc log and start mysqld with --tc-heuristic-recover={commit|rollback}

  ER_TC_RECOVERY_FAILED_THESE_ARE_YOUR_OPTIONS was added in 8.0.2.

- Error: 4149 SQLSTATE: HY000 (ER_TC_HEURISTIC_RECOVERY_MODE)

  Message: Heuristic crash recovery mode

  ER_TC_HEURISTIC_RECOVERY_MODE was added in 8.0.2.

- Error: 4150 SQLSTATE: HY000 (ER_TC_HEURISTIC_RECOVERY_FAILED)

  Message: Heuristic crash recovery failed

  ER_TC_HEURISTIC_RECOVERY_FAILED was added in 8.0.2.

- Error: 4151 SQLSTATE: HY000 (ER_TC_RESTART_WITHOUT_TC_HEURISTIC_RECOVER)

  Message: Please restart mysqld without --tc-heuristic-recover

  ER_TC_RESTART_WITHOUT_TC_HEURISTIC_RECOVER was added in 8.0.2.

- Error: 4152 SQLSTATE: HY000 (ER_RPL_SLAVE_FAILED_TO_CREATE_OR_RECOVER_INFO_REPOSITORIES)

  Message: Failed to create or recover replication info repositories.

  ER_RPL_SLAVE_FAILED_TO_CREATE_OR_RECOVER_INFO_REPOSITORIES was added in 8.0.2.

- Error: 4153 SQLSTATE: HY000 (ER_RPL_SLAVE_AUTO_POSITION_IS_1_AND_GTID_MODE_IS_OFF)

  Message: Detected misconfiguration: replication channel '%s' was configured with AUTO_POSITION = 1, but the server was started with --gtid-mode=off. Either reconfigure replication using CHANGE MASTER TO MASTER_AUTO_POSITION = 0 FOR CHANNEL '%s', or change GTID_MODE to some value other than OFF, before starting the slave receiver thread.

  ER_RPL_SLAVE_AUTO_POSITION_IS_1_AND_GTID_MODE_IS_OFF was added in 8.0.2.

- Error: 4154 SQLSTATE: HY000 (ER_RPL_SLAVE_CANT_START_SLAVE_FOR_CHANNEL)

  Message: Slave: Could not start slave for channel '%s'. operation discontinued

  ER_RPL_SLAVE_CANT_START_SLAVE_FOR_CHANNEL was added in 8.0.2.

- Error: 4155 SQLSTATE: HY000 (ER_RPL_SLAVE_CANT_STOP_SLAVE_FOR_CHANNEL)

  Message: Slave: Could not stop slave for channel '%s' operation discontinued

  ER_RPL_SLAVE_CANT_STOP_SLAVE_FOR_CHANNEL was added in 8.0.2.

- Error: 4156 SQLSTATE: HY000 (ER_RPL_RECOVERY_NO_ROTATE_EVENT_FROM_MASTER)

  Message: Error during --relay-log-recovery: Could not locate rotate event from the master.

  ER_RPL_RECOVERY_NO_ROTATE_EVENT_FROM_MASTER was added in 8.0.2.

- Error: 4157 SQLSTATE: HY000 (ER_RPL_RECOVERY_ERROR_READ_RELAY_LOG)

  Message: Error during --relay-log-recovery: Error reading events from relay log: %d

  ER_RPL_RECOVERY_ERROR_READ_RELAY_LOG was added in 8.0.2.

- Error: 4158 SQLSTATE: HY000 (ER_RPL_RECOVERY_ERROR_FREEING_IO_CACHE)

  Message: Error during --relay-log-recovery: Error while freeing IO_CACHE object

  ER_RPL_RECOVERY_ERROR_FREEING_IO_CACHE was added in 8.0.2.

- Error: 4159 SQLSTATE: HY000 (ER_RPL_RECOVERY_SKIPPED_GROUP_REPLICATION_CHANNEL)

  Message: Relay log recovery skipped for group replication channel.

  ER_RPL_RECOVERY_SKIPPED_GROUP_REPLICATION_CHANNEL was added in 8.0.2.

- Error: 4160 SQLSTATE: HY000 (ER_RPL_RECOVERY_ERROR)

  Message: Error during --relay-log-recovery: %s

  ER_RPL_RECOVERY_ERROR was added in 8.0.2.

- Error: 4161 SQLSTATE: HY000 (ER_RPL_RECOVERY_IO_ERROR_READING_RELAY_LOG_INDEX)

  Message: Error during --relay-log-recovery: Could not read relay log index file due to an IO error.

  ER_RPL_RECOVERY_IO_ERROR_READING_RELAY_LOG_INDEX was added in 8.0.2.

- Error: 4162 SQLSTATE: HY000 (ER_RPL_RECOVERY_FILE_MASTER_POS_INFO)

  Message: Recovery from master pos %ld and file %s%s. Previous relay log pos and relay log file had been set to %lld, %s respectively.

  ER_RPL_RECOVERY_FILE_MASTER_POS_INFO was added in 8.0.2.

- Error: 4163 SQLSTATE: HY000 (ER_RPL_RECOVERY_REPLICATE_SAME_SERVER_ID_REQUIRES_POSITION)

  Message: Error during --relay-log-recovery: replicate_same_server_id is in use and sql thread's positions are not initialized, hence relay log recovery cannot happen.

  ER_RPL_RECOVERY_REPLICATE_SAME_SERVER_ID_REQUIRES_POSITION was added in 8.0.2.

- Error: 4164 SQLSTATE: HY000 (ER_RPL_MTS_RECOVERY_STARTING_COORDINATOR)

  Message: MTS recovery: starting coordinator thread to fill MTS gaps.

  ER_RPL_MTS_RECOVERY_STARTING_COORDINATOR was added in 8.0.2.

- Error: 4165 SQLSTATE: HY000 (ER_RPL_MTS_RECOVERY_FAILED_TO_START_COORDINATOR)

  Message: MTS recovery: failed to start the coordinator thread. Check the error log for additional details.

  ER_RPL_MTS_RECOVERY_FAILED_TO_START_COORDINATOR was added in 8.0.2.

- Error: 4166 SQLSTATE: HY000 (ER_RPL_MTS_AUTOMATIC_RECOVERY_FAILED)

  Message: MTS recovery: automatic recovery failed. Either the slave server had stopped due to an error during an earlier session or relay logs are corrupted.Fix the cause of the slave side error and restart the slave server or consider using RESET SLAVE.

  ER_RPL_MTS_AUTOMATIC_RECOVERY_FAILED was added in 8.0.2.

- Error: 4167 SQLSTATE: HY000 (ER_RPL_MTS_RECOVERY_CANT_OPEN_RELAY_LOG)

  Message: Failed to open the relay log '%s' (relay_log_pos %s).

  ER_RPL_MTS_RECOVERY_CANT_OPEN_RELAY_LOG was added in 8.0.2.

- Error: 4168 SQLSTATE: HY000 (ER_RPL_MTS_RECOVERY_SUCCESSFUL)

  Message: MTS recovery: completed successfully.

  ER_RPL_MTS_RECOVERY_SUCCESSFUL was added in 8.0.2.

- Error: 4169 SQLSTATE: HY000 (ER_RPL_SERVER_ID_MISSING)

  Message: Server id not set, will not start slave%s

  ER_RPL_SERVER_ID_MISSING was added in 8.0.2.

- Error: 4170 SQLSTATE: HY000 (ER_RPL_CANT_CREATE_SLAVE_THREAD)

  Message: Can't create slave thread%s.

  ER_RPL_CANT_CREATE_SLAVE_THREAD was added in 8.0.2.

- Error: 4171 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_WAS_KILLED)

  Message: The slave IO thread%s was killed while executing initialization query '%s'

  ER_RPL_SLAVE_IO_THREAD_WAS_KILLED was added in 8.0.2.

- Error: 4172 SQLSTATE: HY000 (ER_RPL_SLAVE_MASTER_UUID_HAS_CHANGED)

  Message: The master's UUID has changed, although this should not happen unless you have changed it manually. The old UUID was %s.

  ER_RPL_SLAVE_MASTER_UUID_HAS_CHANGED was added in 8.0.2.

- Error: 4173 SQLSTATE: HY000 (ER_RPL_SLAVE_USES_CHECKSUM_AND_MASTER_PRE_50)

  Message: Found a master with MySQL server version older than 5.0. With checksums enabled on the slave, replication might not work correctly. To ensure correct replication, restart the slave server with --slave_sql_verify_checksum=0.

  ER_RPL_SLAVE_USES_CHECKSUM_AND_MASTER_PRE_50 was added in 8.0.2.

- Error: 4174 SQLSTATE: HY000 (ER_RPL_SLAVE_SECONDS_BEHIND_MASTER_DUBIOUS)

  Message: "SELECT UNIX_TIMESTAMP()" failed on master, do not trust column Seconds_Behind_Master of SHOW SLAVE STATUS. Error: %s (%d)

  ER_RPL_SLAVE_SECONDS_BEHIND_MASTER_DUBIOUS was added in 8.0.2.

- Error: 4175 SQLSTATE: HY000 (ER_RPL_SLAVE_CANT_FLUSH_MASTER_INFO_FILE)

  Message: Failed to flush master info file.

ER_RPL_SLAVE_CANT_FLUSH_MASTER_INFO_FILE was added in 8.0.2.

- Error: 4176 SQLSTATE: HY000 (ER_RPL_SLAVE_REPORT_HOST_TOO_LONG)

  Message: The length of report_host is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

  ER_RPL_SLAVE_REPORT_HOST_TOO_LONG was added in 8.0.2.

- Error: 4177 SQLSTATE: HY000 (ER_RPL_SLAVE_REPORT_USER_TOO_LONG)

  Message: The length of report_user is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

  ER_RPL_SLAVE_REPORT_USER_TOO_LONG was added in 8.0.2.

- Error: 4178 SQLSTATE: HY000 (ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG)

  Message: The length of report_password is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

  ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG was added in 8.0.2.

- Error: 4179 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_RETRYING)

  Message: Error on %s: %d %s, will retry in %d secs

  ER_RPL_SLAVE_ERROR_RETRYING was added in 8.0.2.

- Error: 4180 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_READING_FROM_SERVER)

  Message: Error reading packet from server%s: %s (server_errno=%d)

  ER_RPL_SLAVE_ERROR_READING_FROM_SERVER was added in 8.0.2.

- Error: 4181 SQLSTATE: HY000 (ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER)

  Message: Slave%s: received end packet from server due to dump thread being killed on master. Dump threads are killed for example during master shutdown, explicitly by a user, or when the master receives a binlog send request from a duplicate server UUID <%s> : Error %s

  ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER was added in 8.0.2.

- Error: 4182 SQLSTATE: HY000 (ER_RPL_MTS_STATISTICS)

  Message: Multi-threaded slave statistics%s: seconds elapsed = %lu; events assigned = %llu; worker queues filled over overrun level = %lu; waited due a Worker queue full = %lu; waited due the total size = %lu; waited at clock conflicts = %llu waited (count) when Workers occupied = %lu waited when Workers occupied = %llu

  ER_RPL_MTS_STATISTICS was added in 8.0.2.

- Error: 4183 SQLSTATE: HY000 (ER_RPL_MTS_RECOVERY_COMPLETE)

  Message: Slave%s: MTS Recovery has completed at relay log %s, position %llu master log %s, position %llu.

  ER_RPL_MTS_RECOVERY_COMPLETE was added in 8.0.2.

- Error: 4184 SQLSTATE: HY000 (ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION)

  Message: Error initializing relay log position%s: %s

ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION was added in 8.0.2.

- Error: 4185 SQLSTATE: HY000 (ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED)

  Message: Slave I/O thread%s: connected to master '%s@%s:%d',replication started in log '%s' at position %s

  ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED was added in 8.0.2.

- Error: 4186 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_KILLED)

  Message: Slave I/O thread%s killed while connecting to master

  ER_RPL_SLAVE_IO_THREAD_KILLED was added in 8.0.2.

- Error: 4187 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER)

  Message: Slave I/O thread couldn't register on master

  ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER was added in 8.0.2.

- Error: 4188 SQLSTATE: HY000 (ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD)

  Message: Forcing to reconnect slave I/O thread%s

  ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD was added in 8.0.2.

- Error: 4189 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP)

  Message: Failed on request_dump()%s

  ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP was added in 8.0.2.

- Error: 4190 SQLSTATE: HY000 (ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET)

  Message: Log entry on master is longer than slave_max_allowed_packet (%lu) on slave. If the entry is correct, restart the server with a higher value of slave_max_allowed_packet

  ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET was added in 8.0.2.

- Error: 4191 SQLSTATE: HY000 (ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM)

  Message: Stopping slave I/O thread due to out-of-memory error from master

  ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM was added in 8.0.2.

- Error: 4192 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE)

  Message: Slave I/O thread aborted while waiting for relay log space

  ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE was added in 8.0.2.

- Error: 4193 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_EXITING)

  Message: Slave I/O thread exiting%s, read up to log '%s', position %s

  ER_RPL_SLAVE_IO_THREAD_EXITING was added in 8.0.2.

- Error: 4194 SQLSTATE: HY000 (ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER)

Message: Failed during slave worker initialization%s

ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER was added in 8.0.2.

- Error: 4195 SQLSTATE: HY000 (ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER)

  Message: Slave: MTS group recovery relay log info based on Worker-Id %lu, group_relay_log_name %s, group_relay_log_pos %llu group_master_log_name %s, group_master_log_pos %llu

  ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER was added in 8.0.2.

- Error: 4196 SQLSTATE: HY000 (ER_RPL_ERROR_LOOKING_FOR_LOG)

  Message: Error looking for %s.

  ER_RPL_ERROR_LOOKING_FOR_LOG was added in 8.0.2.

- Error: 4197 SQLSTATE: HY000 (ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO)

  Message: Slave: MTS group recovery relay log info group_master_log_name %s, event_master_log_pos %llu.

  ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO was added in 8.0.2.

- Error: 4198 SQLSTATE: HY000 (ER_RPL_CANT_FIND_FOLLOWUP_FILE)

  Message: Error looking for file after %s.

  ER_RPL_CANT_FIND_FOLLOWUP_FILE was added in 8.0.2.

- Error: 4199 SQLSTATE: HY000 (ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT)

  Message: This an error cnt != mts_checkpoint_period

  ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT was added in 8.0.2.

- Error: 4200 SQLSTATE: HY000 (ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED)

  Message: Failed during slave worker thread creation%s

  ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED was added in 8.0.2.

- Error: 4201 SQLSTATE: HY000 (ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO)

  Message: Failed during slave worker thread creation%s (errno= %d)

  ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO was added in 8.0.2.

- Error: 4202 SQLSTATE: HY000 (ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH)

  Message: Failed to init partitions hash

  ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH was added in 8.0.2.

- Error: 4203 SQLSTATE: HY000 (ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE)

  Message: Slave SQL thread : NDB : Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value

  ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE was added in 8.0.2.

- Error: 4204 SQLSTATE: HY000 (ER_RPL_SLAVE_SQL_THREAD_STARTING)

  Message: Slave SQL thread%s initialized, starting replication in log '%s' at position %s, relay log '%s' position: %s

  ER_RPL_SLAVE_SQL_THREAD_STARTING was added in 8.0.2.

- Error: 4205 SQLSTATE: HY000 (ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED)

  Message: 'SQL_SLAVE_SKIP_COUNTER=%ld' executed at relay_log_file='%s', relay_log_pos='%ld', master_log_name='%s', master_log_pos='%ld' and new position at relay_log_file='%s', relay_log_pos='%ld', master_log_name='%s', master_log_pos='%ld'

  ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED was added in 8.0.2.

- Error: 4206 SQLSTATE: HY000 (ER_RPL_SLAVE_ADDITIONAL_ERROR_INFO_FROM_DA)

  Message: Slave (additional info): %s Error_code: %d

  ER_RPL_SLAVE_ADDITIONAL_ERROR_INFO_FROM_DA was added in 8.0.2.

- Error: 4207 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_INFO_FROM_DA)

  Message: Slave: %s Error_code: %d

  ER_RPL_SLAVE_ERROR_INFO_FROM_DA was added in 8.0.2.

- Error: 4208 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_LOADING_USER_DEFINED_LIBRARY)

  Message: Error loading user-defined library, slave SQL thread aborted. Install the missing library, and restart the slave SQL thread with "SLAVE START". We stopped at log '%s' position %s

  ER_RPL_SLAVE_ERROR_LOADING_USER_DEFINED_LIBRARY was added in 8.0.2.

- Error: 4209 SQLSTATE: HY000 (ER_RPL_SLAVE_ERROR_RUNNING_QUERY)

  Message: Error running query, slave SQL thread aborted. Fix the problem, and restart the slave SQL thread with "SLAVE START". We stopped at log '%s' position %s

  ER_RPL_SLAVE_ERROR_RUNNING_QUERY was added in 8.0.2.

- Error: 4210 SQLSTATE: HY000 (ER_RPL_SLAVE_SQL_THREAD_EXITING)

  Message: Slave SQL thread%s exiting, replication stopped in log '%s' at position %s

  ER_RPL_SLAVE_SQL_THREAD_EXITING was added in 8.0.2.

- Error: 4211 SQLSTATE: HY000 (ER_RPL_SLAVE_READ_INVALID_EVENT_FROM_MASTER)

  Message: Read invalid event from master: '%s', master could be corrupt but a more likely cause of this is a bug

  ER_RPL_SLAVE_READ_INVALID_EVENT_FROM_MASTER was added in 8.0.2.

- Error: 4212 SQLSTATE: HY000 (ER_RPL_SLAVE_QUEUE_EVENT_FAILED_INVALID_CONFIGURATION)

  Message: The queue event failed for channel '%s' as its configuration is invalid.

  ER_RPL_SLAVE_QUEUE_EVENT_FAILED_INVALID_CONFIGURATION was added in 8.0.2.

- Error: 4213 SQLSTATE: HY000 (ER_RPL_SLAVE_IO_THREAD_DETECTED_UNEXPECTED_EVENT_SEQUENCE)

Message: An unexpected event sequence was detected by the IO thread while queuing the event received from master '%s' binary log file, at position %llu.

`ER_RPL_SLAVE_IO_THREAD_DETECTED_UNEXPECTED_EVENT_SEQUENCE` was added in 8.0.2.

- Error: `4214` SQLSTATE: `HY000` (`ER_RPL_SLAVE_CANT_USE_CHARSET`)

  Message: '%s' can not be used as client character set. '%s' will be used as default client character set while connecting to master.

  `ER_RPL_SLAVE_CANT_USE_CHARSET` was added in 8.0.2.

- Error: `4215` SQLSTATE: `HY000` (`ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_RESUMED`)

  Message: Slave%s: connected to master '%s@%s:%d',replication resumed in log '%s' at position %s

  `ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_RESUMED` was added in 8.0.2.

- Error: `4216` SQLSTATE: `HY000` (`ER_RPL_SLAVE_NEXT_LOG_IS_ACTIVE`)

  Message: next log '%s' is active

  `ER_RPL_SLAVE_NEXT_LOG_IS_ACTIVE` was added in 8.0.2.

- Error: `4217` SQLSTATE: `HY000` (`ER_RPL_SLAVE_NEXT_LOG_IS_INACTIVE`)

  Message: next log '%s' is not active

  `ER_RPL_SLAVE_NEXT_LOG_IS_INACTIVE` was added in 8.0.2.

- Error: `4218` SQLSTATE: `HY000` (`ER_RPL_SLAVE_SQL_THREAD_IO_ERROR_READING_EVENT`)

  Message: Slave SQL thread%s: I/O error reading event (errno: %d cur_log->error: %d)

  `ER_RPL_SLAVE_SQL_THREAD_IO_ERROR_READING_EVENT` was added in 8.0.2.

- Error: `4219` SQLSTATE: `HY000` (`ER_RPL_SLAVE_ERROR_READING_RELAY_LOG_EVENTS`)

  Message: Error reading relay log event%s: %s

  `ER_RPL_SLAVE_ERROR_READING_RELAY_LOG_EVENTS` was added in 8.0.2.

- Error: `4220` SQLSTATE: `HY000` (`ER_SLAVE_CHANGE_MASTER_TO_EXECUTED`)

  Message: 'CHANGE MASTER TO%s executed'. Previous state master_host='%s', master_port= %u, master_log_file='%s', master_log_pos= %ld, master_bind='%s'. New state master_host='%s', master_port= %u, master_log_file='%s', master_log_pos= %ld, master_bind='%s'.

  `ER_SLAVE_CHANGE_MASTER_TO_EXECUTED` was added in 8.0.2.

- Error: `4221` SQLSTATE: `HY000` (`ER_RPL_SLAVE_NEW_MASTER_INFO_NEEDS_REPOS_TYPE_OTHER_THAN_FILE`)

  Message: Slave: Cannot create new master info structure when repositories are of type FILE. Convert slave repositories to TABLE to replicate from multiple sources.

  `ER_RPL_SLAVE_NEW_MASTER_INFO_NEEDS_REPOS_TYPE_OTHER_THAN_FILE` was added in 8.0.2.

- Error: `4222` SQLSTATE: `HY000` (`ER_RPL_FAILED_TO_STAT_LOG_IN_INDEX`)

  Message: log %s listed in the index, but failed to stat.

ER_RPL_FAILED_TO_STAT_LOG_IN_INDEX was added in 8.0.2.

- Error: 4223 SQLSTATE: HY000 (ER_RPL_LOG_NOT_FOUND_WHILE_COUNTING_RELAY_LOG_SPACE)

  Message: Could not find first log while counting relay log space.

  ER_RPL_LOG_NOT_FOUND_WHILE_COUNTING_RELAY_LOG_SPACE was added in 8.0.2.

- Error: 4224 SQLSTATE: HY000 (ER_SLAVE_CANT_USE_TEMPDIR)

  Message: Unable to use slave's temporary directory '%s'.

  ER_SLAVE_CANT_USE_TEMPDIR was added in 8.0.2.

- Error: 4225 SQLSTATE: HY000 (ER_RPL_RELAY_LOG_NEEDS_FILE_NOT_DIRECTORY)

  Message: Path '%s' is a directory name, please specify a file name for --relay-log option.

  ER_RPL_RELAY_LOG_NEEDS_FILE_NOT_DIRECTORY was added in 8.0.2.

- Error: 4226 SQLSTATE: HY000 (ER_RPL_RELAY_LOG_INDEX_NEEDS_FILE_NOT_DIRECTORY)

  Message: Path '%s' is a directory name, please specify a file name for --relay-log-index option.

  ER_RPL_RELAY_LOG_INDEX_NEEDS_FILE_NOT_DIRECTORY was added in 8.0.2.

- Error: 4227 SQLSTATE: HY000 (ER_RPL_PLEASE_USE_OPTION_RELAY_LOG)

  Message: Neither --relay-log nor --relay-log-index were used; so replication may break when this MySQL server acts as a slave and has his hostname changed!! Please use '--relay-log=%s' to avoid this problem.

  ER_RPL_PLEASE_USE_OPTION_RELAY_LOG was added in 8.0.2.

- Error: 4228 SQLSTATE: HY000 (ER_RPL_OPEN_INDEX_FILE_FAILED)

  Message: Failed in open_index_file() called from Relay_log_info::rli_init_info().

  ER_RPL_OPEN_INDEX_FILE_FAILED was added in 8.0.2.

- Error: 4229 SQLSTATE: HY000 (ER_RPL_CANT_INITIALIZE_GTID_SETS_IN_RLI_INIT_INFO)

  Message: Failed in init_gtid_sets() called from Relay_log_info::rli_init_info().

  ER_RPL_CANT_INITIALIZE_GTID_SETS_IN_RLI_INIT_INFO was added in 8.0.2.

- Error: 4230 SQLSTATE: HY000 (ER_RPL_CANT_OPEN_LOG_IN_RLI_INIT_INFO)

  Message: Failed in open_log() called from Relay_log_info::rli_init_info().

  ER_RPL_CANT_OPEN_LOG_IN_RLI_INIT_INFO was added in 8.0.2.

- Error: 4231 SQLSTATE: HY000 (ER_RPL_ERROR_WRITING_RELAY_LOG_CONFIGURATION)

  Message: Error writing relay log configuration.

  ER_RPL_ERROR_WRITING_RELAY_LOG_CONFIGURATION was added in 8.0.2.

- Error: 4232 SQLSTATE: HY000 (ER_NDB_OOM_GET_NDB_BLOBS_VALUE)

  Message: get_ndb_blobs_value: my_malloc(%u) failed

ER_NDB_OOM_GET_NDB_BLOBS_VALUE was added in 8.0.2.

- Error: 4233 SQLSTATE: HY000 (ER_NDB_THREAD_TIMED_OUT)

  Message: NDB: Thread id %u timed out (30s) waiting for epoch %u/%u to be handled. Progress : %u/%u -> %u/%u.

  ER_NDB_THREAD_TIMED_OUT was added in 8.0.2.

- Error: 4234 SQLSTATE: HY000 (ER_NDB_TABLE_IS_NOT_DISTRIBUTED)

  Message: NDB: Inconsistency detected in distributed privilege tables. Table '%s.%s' is not distributed

  ER_NDB_TABLE_IS_NOT_DISTRIBUTED was added in 8.0.2.

- Error: 4235 SQLSTATE: HY000 (ER_NDB_CREATING_TABLE)

  Message: NDB: Creating %s.%s

  ER_NDB_CREATING_TABLE was added in 8.0.2.

- Error: 4236 SQLSTATE: HY000 (ER_NDB_FLUSHING_TABLE_INFO)

  ER_NDB_CREATE_EVENT_OPS_LOGGING_INFO was added in 8.0.2.

- Error: 4307 SQLSTATE: HY000 (ER_NDB_BINLOG_CANT_DROP_EVENT_FROM_DB)

  Message: NDB Binlog: Unable to drop event in database. Event: %s Error Code: %d Message: %s

  ER_NDB_BINLOG_CANT_DROP_EVENT_FROM_DB was added in 8.0.2.

- Error: 4308 SQLSTATE: HY000 (ER_NDB_TIMED_OUT_IN_DROP_TABLE)

  Message: NDB %s: %s timed out. Ignoring...

  ER_NDB_TIMED_OUT_IN_DROP_TABLE was added in 8.0.2.

- Error: 4309 SQLSTATE: HY000 (ER_NDB_BINLOG_UNHANDLED_ERROR_FOR_TABLE)

  Message: NDB Binlog: unhandled error %d for table %s

  ER_NDB_BINLOG_UNHANDLED_ERROR_FOR_TABLE was added in 8.0.2.

- Error: 4310 SQLSTATE: HY000 (ER_NDB_BINLOG_CLUSTER_FAILURE)

  Message: NDB Binlog: cluster failure for %s at epoch %u/%u.

  ER_NDB_BINLOG_CLUSTER_FAILURE was added in 8.0.2.

- Error: 4311 SQLSTATE: HY000 (ER_NDB_BINLOG_UNKNOWN_NON_DATA_EVENT)

  Message: NDB Binlog: unknown non data event %d for %s. Ignoring...

  ER_NDB_BINLOG_UNKNOWN_NON_DATA_EVENT was added in 8.0.2.

- Error: 4312 SQLSTATE: HY000 (ER_NDB_BINLOG_INJECTOR_DISCARDING_ROW_EVENT_METADATA)

  Message: NDB: Binlog Injector discarding row event meta data as server is using v1 row events. (%u %x)

  ER_NDB_BINLOG_INJECTOR_DISCARDING_ROW_EVENT_METADATA was added in 8.0.2.

- Error: 4313 SQLSTATE: HY000 (ER_NDB_REMAINING_OPEN_TABLES)

  Message: remove_all_event_operations: Remaining open tables:

ER_NDB_REMAINING_OPEN_TABLES was added in 8.0.2.

- Error: 4314 SQLSTATE: HY000 (ER_NDB_REMAINING_OPEN_TABLE_INFO)

  Message: %s.%s, use_count: %u

  ER_NDB_REMAINING_OPEN_TABLE_INFO was added in 8.0.2.

- Error: 4315 SQLSTATE: HY000 (ER_NDB_COULD_NOT_GET_APPLY_STATUS_SHARE)

  Message: NDB: Could not get apply status share

  ER_NDB_COULD_NOT_GET_APPLY_STATUS_SHARE was added in 8.0.2.

- Error: 4316 SQLSTATE: HY000 (ER_NDB_BINLOG_SERVER_SHUTDOWN_DURING_NDB_CLUSTER_START)

  Message: NDB Binlog: Server shutdown detected while waiting for ndbcluster to start...

  ER_NDB_BINLOG_SERVER_SHUTDOWN_DURING_NDB_CLUSTER_START was added in 8.0.2.

- Error: 4317 SQLSTATE: HY000 (ER_NDB_BINLOG_CLUSTER_RESTARTED_RESET_MASTER_SUGGESTED)

  Message: NDB Binlog: cluster has been restarted --initial or with older filesystem. ndb_latest_handled_binlog_epoch: %u/%u, while current epoch: %u/%u. RESET MASTER should be issued. Resetting ndb_latest_handled_binlog_epoch.

  ER_NDB_BINLOG_CLUSTER_RESTARTED_RESET_MASTER_SUGGESTED was added in 8.0.2.

- Error: 4318 SQLSTATE: HY000 (ER_NDB_BINLOG_CLUSTER_HAS_RECONNECTED)

  Message: NDB Binlog: cluster has reconnected. Changes to the database that occured while disconnected will not be in the binlog

  ER_NDB_BINLOG_CLUSTER_HAS_RECONNECTED was added in 8.0.2.

- Error: 4319 SQLSTATE: HY000 (ER_NDB_BINLOG_STARTING_LOG_AT_EPOCH)

  Message: NDB Binlog: starting log at epoch %u/%u

  ER_NDB_BINLOG_STARTING_LOG_AT_EPOCH was added in 8.0.2.

- Error: 4320 SQLSTATE: HY000 (ER_NDB_BINLOG_NDB_TABLES_WRITABLE)

  Message: NDB Binlog: ndb tables writable

  ER_NDB_BINLOG_NDB_TABLES_WRITABLE was added in 8.0.2.

- Error: 4321 SQLSTATE: HY000 (ER_NDB_BINLOG_SHUTDOWN_DETECTED)

  Message: NDB Binlog: Server shutdown detected...

  ER_NDB_BINLOG_SHUTDOWN_DETECTED was added in 8.0.2.

- Error: 4322 SQLSTATE: HY000 (ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_WAITING)

  Message: NDB Binlog: Just lost schema connection, hanging around

  ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_WAITING was added in 8.0.2.

- Error: 4323 SQLSTATE: HY000 (ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_CONTINUING)

Message: NDB Binlog: ...and on our way

ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_CONTINUING was added in 8.0.2.

- Error: 4324 SQLSTATE: HY000 (ER_NDB_BINLOG_ERROR_HANDLING_SCHEMA_EVENT)

  Message: NDB: error %lu (%s) on handling binlog schema event

  ER_NDB_BINLOG_ERROR_HANDLING_SCHEMA_EVENT was added in 8.0.2.

- Error: 4325 SQLSTATE: HY000 (ER_NDB_BINLOG_CANT_INJECT_APPLY_STATUS_WRITE_ROW)

  Message: NDB Binlog: Failed to inject apply status write row

  ER_NDB_BINLOG_CANT_INJECT_APPLY_STATUS_WRITE_ROW was added in 8.0.2.

- Error: 4326 SQLSTATE: HY000 (ER_NDB_BINLOG_ERROR_DURING_GCI_ROLLBACK)

  Message: NDB Binlog: Error during ROLLBACK of GCI %u/%u. Error: %d

  ER_NDB_BINLOG_ERROR_DURING_GCI_ROLLBACK was added in 8.0.2.

- Error: 4327 SQLSTATE: HY000 (ER_NDB_BINLOG_ERROR_DURING_GCI_COMMIT)

  Message: NDB Binlog: Error during COMMIT of GCI. Error: %d

  ER_NDB_BINLOG_ERROR_DURING_GCI_COMMIT was added in 8.0.2.

- Error: 4328 SQLSTATE: HY000 (ER_NDB_BINLOG_LATEST_TRX_IN_EPOCH_NOT_IN_BINLOG)

  Message: NDB Binlog: latest transaction in epoch %u/%u not in binlog as latest handled epoch is %u/%u

  ER_NDB_BINLOG_LATEST_TRX_IN_EPOCH_NOT_IN_BINLOG was added in 8.0.2.

- Error: 4329 SQLSTATE: HY000 (ER_NDB_BINLOG_RELEASING_EXTRA_SHARE_REFERENCES)

  Message: NDB Binlog: Release extra share references

  ER_NDB_BINLOG_RELEASING_EXTRA_SHARE_REFERENCES was added in 8.0.2.

- Error: 4330 SQLSTATE: HY000 (ER_NDB_BINLOG_REMAINING_OPEN_TABLES)

  Message: NDB Binlog: remaining open tables:

  ER_NDB_BINLOG_REMAINING_OPEN_TABLES was added in 8.0.2.

- Error: 4331 SQLSTATE: HY000 (ER_NDB_BINLOG_REMAINING_OPEN_TABLE_INFO)

  Message: %s.%s state: %u use_count: %u

  ER_NDB_BINLOG_REMAINING_OPEN_TABLE_INFO was added in 8.0.2.

- Error: 4332 SQLSTATE: HY000 (ER_TREE_CORRUPT_PARENT_SHOULD_POINT_AT_PARENT)

  Message: Wrong tree: Parent doesn't point at parent

  ER_TREE_CORRUPT_PARENT_SHOULD_POINT_AT_PARENT was added in 8.0.2.

- Error: 4333 SQLSTATE: HY000 (ER_TREE_CORRUPT_ROOT_SHOULD_BE_BLACK)

  Message: Wrong tree: Root should be black

  ER_TREE_CORRUPT_ROOT_SHOULD_BE_BLACK was added in 8.0.2.

- Error: 4334 SQLSTATE: HY000 (ER_TREE_CORRUPT_2_CONSECUTIVE_REDS)

  Message: Wrong tree: Found two red in a row

  ER_TREE_CORRUPT_2_CONSECUTIVE_REDS was added in 8.0.2.
- Error: 4335 SQLSTATE: HY000 (ER_TREE_CORRUPT_RIGHT_IS_LEFT)

  Message: Wrong tree: Found right == left

  ER_TREE_CORRUPT_RIGHT_IS_LEFT was added in 8.0.2.
- Error: 4336 SQLSTATE: HY000 (ER_TREE_CORRUPT_INCORRECT_BLACK_COUNT)

  Message: Wrong tree: Incorrect black-count: %d - %d

  ER_TREE_CORRUPT_INCORRECT_BLACK_COUNT was added in 8.0.2.
- Error: 4337 SQLSTATE: HY000 (ER_WRONG_COUNT_FOR_ORIGIN)

  Message: Use_count: Wrong count %lu for origin %p

  ER_WRONG_COUNT_FOR_ORIGIN was added in 8.0.2.
- Error: 4338 SQLSTATE: HY000 (ER_WRONG_COUNT_FOR_KEY)

  Message: Use_count: Wrong count for key at %p, %lu should be %lu

  ER_WRONG_COUNT_FOR_KEY was added in 8.0.2.
- Error: 4339 SQLSTATE: HY000 (ER_WRONG_COUNT_OF_ELEMENTS)

  Message: Wrong number of elements: %u (should be %u) for tree at %p

  ER_WRONG_COUNT_OF_ELEMENTS was added in 8.0.2.
- Error: 4340 SQLSTATE: HY000 (ER_RPL_ERROR_READING_SLAVE_WORKER_CONFIGURATION)

  Message: Error reading slave worker configuration

  ER_RPL_ERROR_READING_SLAVE_WORKER_CONFIGURATION was added in 8.0.2.
- Error: 4341 SQLSTATE: HY000 (ER_RPL_ERROR_WRITING_SLAVE_WORKER_CONFIGURATION)

  Message: Error writing slave worker configuration

  ER_RPL_ERROR_WRITING_SLAVE_WORKER_CONFIGURATION was added in 8.0.2.
- Error: 4342 SQLSTATE: HY000 (ER_RPL_FAILED_TO_OPEN_RELAY_LOG)

  Message: Failed to open relay log %s, error: %s

  ER_RPL_FAILED_TO_OPEN_RELAY_LOG was added in 8.0.2.
- Error: 4343 SQLSTATE: HY000 (ER_RPL_WORKER_CANT_READ_RELAY_LOG)

  Message: Error when worker read relay log events,relay log name %s, position %llu

  ER_RPL_WORKER_CANT_READ_RELAY_LOG was added in 8.0.2.
- Error: 4344 SQLSTATE: HY000 (ER_RPL_WORKER_CANT_FIND_NEXT_RELAY_LOG)

  Message: Failed to find next relay log when retrying the transaction, current relay log is %s

  ER_RPL_WORKER_CANT_FIND_NEXT_RELAY_LOG was added in 8.0.2.

- Error: 4345 SQLSTATE: HY000 (ER_RPL_MTS_SLAVE_COORDINATOR_HAS_WAITED)

  Message: Multi-threaded slave: Coordinator has waited %lu times hitting slave_pending_jobs_size_max; current event size = %zu.

  ER_RPL_MTS_SLAVE_COORDINATOR_HAS_WAITED was added in 8.0.2.

- Error: 4346 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_WRITE_DROP_FOR_TEMP_TABLES)

  Message: Failed to write the DROP statement for temporary tables to binary log

  ER_BINLOG_FAILED_TO_WRITE_DROP_FOR_TEMP_TABLES was added in 8.0.2.

- Error: 4347 SQLSTATE: HY000 (ER_BINLOG_OOM_WRITING_DELETE_WHILE_OPENING_HEAP_TABLE)

  Message: When opening HEAP table, could not allocate memory to write 'DELETE FROM `%s`.`%s`' to the binary log

  ER_BINLOG_OOM_WRITING_DELETE_WHILE_OPENING_HEAP_TABLE was added in 8.0.2.

- Error: 4348 SQLSTATE: HY000 (ER_FAILED_TO_REPAIR_TABLE)

  Message: Couldn't repair table: %s.%s

  ER_FAILED_TO_REPAIR_TABLE was added in 8.0.2.

- Error: 4349 SQLSTATE: HY000 (ER_FAILED_TO_REMOVE_TEMP_TABLE)

  Message: Could not remove temporary table: '%s', error: %d

  ER_FAILED_TO_REMOVE_TEMP_TABLE was added in 8.0.2.

- Error: 4350 SQLSTATE: HY000 (ER_SYSTEM_TABLE_NOT_TRANSACTIONAL)

  Message: System table '%.*s' is expected to be transactional.

  ER_SYSTEM_TABLE_NOT_TRANSACTIONAL was added in 8.0.2.

- Error: 4351 SQLSTATE: HY000 (ER_RPL_ERROR_WRITING_MASTER_CONFIGURATION)

  Message: Error writing master configuration.

  ER_RPL_ERROR_WRITING_MASTER_CONFIGURATION was added in 8.0.2.

- Error: 4352 SQLSTATE: HY000 (ER_RPL_ERROR_READING_MASTER_CONFIGURATION)

  Message: Error reading master configuration.

  ER_RPL_ERROR_READING_MASTER_CONFIGURATION was added in 8.0.2.

- Error: 4353 SQLSTATE: HY000 (ER_RPL_SSL_INFO_IN_MASTER_INFO_IGNORED)

  Message: SSL information in the master info file are ignored because this MySQL slave was compiled without SSL support.

  ER_RPL_SSL_INFO_IN_MASTER_INFO_IGNORED was added in 8.0.2.

- Error: 4354 SQLSTATE: HY000 (ER_PLUGIN_FAILED_DEINITIALIZATION)

  Message: Plugin '%s' of type %s failed deinitialization

  ER_PLUGIN_FAILED_DEINITIALIZATION was added in 8.0.2.

- Error: 4355 SQLSTATE: HY000 (ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_DEINITIALIZATION)

  Message: Plugin '%s' has ref_count=%d after deinitialization.

  ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_DEINITIALIZATION was added in 8.0.2.

- Error: 4356 SQLSTATE: HY000 (ER_PLUGIN_SHUTTING_DOWN_PLUGIN)

  Message: Shutting down plugin '%s'

  ER_PLUGIN_SHUTTING_DOWN_PLUGIN was added in 8.0.2.

- Error: 4357 SQLSTATE: HY000 (ER_PLUGIN_REGISTRATION_FAILED)

  Message: Plugin '%s' registration as a %s failed.

  ER_PLUGIN_REGISTRATION_FAILED was added in 8.0.2.

- Error: 4358 SQLSTATE: HY000 (ER_PLUGIN_CANT_OPEN_PLUGIN_TABLE)

  Message: Can't open the mysql.plugin table. Please run mysql_upgrade to create it.

  ER_PLUGIN_CANT_OPEN_PLUGIN_TABLE was added in 8.0.2.

- Error: 4359 SQLSTATE: HY000 (ER_PLUGIN_CANT_LOAD)

  Message: Couldn't load plugin named '%s' with soname '%s'.

  ER_PLUGIN_CANT_LOAD was added in 8.0.2.

- Error: 4360 SQLSTATE: HY000 (ER_PLUGIN_LOAD_PARAMETER_TOO_LONG)

  Message: plugin-load parameter too long

  ER_PLUGIN_LOAD_PARAMETER_TOO_LONG was added in 8.0.2.

- Error: 4361 SQLSTATE: HY000 (ER_PLUGIN_FORCING_SHUTDOWN)

  Message: Plugin '%s' will be forced to shutdown

  ER_PLUGIN_FORCING_SHUTDOWN was added in 8.0.2.

- Error: 4362 SQLSTATE: HY000 (ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_SHUTDOWN)

  Message: Plugin '%s' has ref_count=%d after shutdown.

  ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_SHUTDOWN was added in 8.0.2.

- Error: 4363 SQLSTATE: HY000 (ER_PLUGIN_UNKNOWN_VARIABLE_TYPE)

  Message: Unknown variable type code 0x%x in plugin '%s'.

  ER_PLUGIN_UNKNOWN_VARIABLE_TYPE was added in 8.0.2.

- Error: 4364 SQLSTATE: HY000 (ER_PLUGIN_VARIABLE_SET_READ_ONLY)

  Message: Server variable %s of plugin %s was forced to be read-only: string variable without update_func and PLUGIN_VAR_MEMALLOC flag

  ER_PLUGIN_VARIABLE_SET_READ_ONLY was added in 8.0.2.

- Error: 4365 SQLSTATE: HY000 (ER_PLUGIN_VARIABLE_MISSING_NAME)

Message: Missing variable name in plugin '%s'.

`ER_PLUGIN_VARIABLE_MISSING_NAME` was added in 8.0.2.

- Error: `4366` SQLSTATE: `HY000` (`ER_PLUGIN_VARIABLE_NOT_ALLOCATED_THREAD_LOCAL`)

  Message: Thread local variable '%s' not allocated in plugin '%s'.

  `ER_PLUGIN_VARIABLE_NOT_ALLOCATED_THREAD_LOCAL` was added in 8.0.2.

- Error: `4367` SQLSTATE: `HY000` (`ER_PLUGIN_OOM`)

  Message: Out of memory for plugin '%s'.

  `ER_PLUGIN_OOM` was added in 8.0.2.

- Error: `4368` SQLSTATE: `HY000` (`ER_PLUGIN_BAD_OPTIONS`)

  Message: Bad options for plugin '%s'.

  `ER_PLUGIN_BAD_OPTIONS` was added in 8.0.2.

- Error: `4369` SQLSTATE: `HY000` (`ER_PLUGIN_PARSING_OPTIONS_FAILED`)

  Message: Parsing options for plugin '%s' failed.

  `ER_PLUGIN_PARSING_OPTIONS_FAILED` was added in 8.0.2.

- Error: `4370` SQLSTATE: `HY000` (`ER_PLUGIN_DISABLED`)

  Message: Plugin '%s' is disabled.

  `ER_PLUGIN_DISABLED` was added in 8.0.2.

- Error: `4371` SQLSTATE: `HY000` (`ER_PLUGIN_HAS_CONFLICTING_SYSTEM_VARIABLES`)

  Message: Plugin '%s' has conflicting system variables

  `ER_PLUGIN_HAS_CONFLICTING_SYSTEM_VARIABLES` was added in 8.0.2.

- Error: `4372` SQLSTATE: `HY000` (`ER_PLUGIN_CANT_SET_PERSISTENT_OPTIONS`)

  Message: Setting persistent options for plugin '%s' failed.

  `ER_PLUGIN_CANT_SET_PERSISTENT_OPTIONS` was added in 8.0.2.

- Error: `4373` SQLSTATE: `HY000` (`ER_MY_NET_WRITE_FAILED_FALLING_BACK_ON_STDERR`)

  Message: Failed on my_net_write, writing to stderr instead: %s

  `ER_MY_NET_WRITE_FAILED_FALLING_BACK_ON_STDERR` was added in 8.0.2.

- Error: `4374` SQLSTATE: `HY000` (`ER_RETRYING_REPAIR_WITHOUT_QUICK`)

  Message: Retrying repair of: '%s' without quick

  `ER_RETRYING_REPAIR_WITHOUT_QUICK` was added in 8.0.2.

- Error: `4375` SQLSTATE: `HY000` (`ER_RETRYING_REPAIR_WITH_KEYCACHE`)

  Message: Retrying repair of: '%s' with keycache

  `ER_RETRYING_REPAIR_WITH_KEYCACHE` was added in 8.0.2.

- Error: 4376 SQLSTATE: HY000 (ER_FOUND_ROWS_WHILE_REPAIRING)

  Message: Found %s of %s rows when repairing '%s'

  ER_FOUND_ROWS_WHILE_REPAIRING was added in 8.0.2.
- Error: 4377 SQLSTATE: HY000 (ER_ERROR_DURING_OPTIMIZE_TABLE)

  Message: Warning: Optimize table got errno %d on %s.%s, retrying

  ER_ERROR_DURING_OPTIMIZE_TABLE was added in 8.0.2.
- Error: 4378 SQLSTATE: HY000 (ER_ERROR_ENABLING_KEYS)

  Message: Warning: Enabling keys got errno %d on %s.%s, retrying

  ER_ERROR_ENABLING_KEYS was added in 8.0.2.
- Error: 4379 SQLSTATE: HY000 (ER_CHECKING_TABLE)

  Message: Checking table: '%s'

  ER_CHECKING_TABLE was added in 8.0.2.
- Error: 4380 SQLSTATE: HY000 (ER_RECOVERING_TABLE)

  Message: Recovering table: '%s'

  ER_RECOVERING_TABLE was added in 8.0.2.
- Error: 4381 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE_SHARE_FROM_FRM)

  Message: Error in creating TABLE_SHARE from %s.frm file.

  ER_CANT_CREATE_TABLE_SHARE_FROM_FRM was added in 8.0.2.
- Error: 4382 SQLSTATE: HY000 (ER_CANT_LOCK_TABLE)

  Message: Unable to acquire lock on %s.%s

  ER_CANT_LOCK_TABLE was added in 8.0.2.
- Error: 4383 SQLSTATE: HY000 (ER_CANT_ALLOC_TABLE_OBJECT)

  Message: Error in allocation memory for TABLE object.

  ER_CANT_ALLOC_TABLE_OBJECT was added in 8.0.2.
- Error: 4384 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_OBJECT_FOR_TABLE)

  Message: Error in creating handler object for table %s.%s

  ER_CANT_CREATE_HANDLER_OBJECT_FOR_TABLE was added in 8.0.2.
- Error: 4385 SQLSTATE: HY000 (ER_CANT_SET_HANDLER_REFERENCE_FOR_TABLE)

  Message: Error in setting handler reference for table %s.%s

  ER_CANT_SET_HANDLER_REFERENCE_FOR_TABLE was added in 8.0.2.
- Error: 4386 SQLSTATE: HY000 (ER_CANT_LOCK_TABLESPACE)

  Message: Unable to acquire lock on tablespace name %s

  ER_CANT_LOCK_TABLESPACE was added in 8.0.2.

- Error: 4387 SQLSTATE: HY000 (ER_CANT_UPGRADE_GENERATED_COLUMNS_TO_DD)

  Message: Error in processing generated columns

  ER_CANT_UPGRADE_GENERATED_COLUMNS_TO_DD was added in 8.0.2.
- Error: 4388 SQLSTATE: HY000 (ER_DD_ERROR_CREATING_ENTRY)

  Message: Error in Creating DD entry for %s.%s

  ER_DD_ERROR_CREATING_ENTRY was added in 8.0.2.
- Error: 4389 SQLSTATE: HY000 (ER_DD_CANT_FETCH_TABLE_DATA)

  Message: Error in fetching %s.%s table data from dictionary

  ER_DD_CANT_FETCH_TABLE_DATA was added in 8.0.2.
- Error: 4390 SQLSTATE: HY000 (ER_DD_CANT_FIX_SE_DATA)

  Message: Error in fixing SE data for %s.%s

  ER_DD_CANT_FIX_SE_DATA was added in 8.0.2.
- Error: 4391 SQLSTATE: HY000 (ER_DD_CANT_CREATE_SP)

  Message: Error in creating stored program '%s.%s'

  ER_DD_CANT_CREATE_SP was added in 8.0.2.
- Error: 4392 SQLSTATE: HY000 (ER_CANT_OPEN_DB_OPT_USING_DEFAULT_CHARSET)

  Message: Unable to open db.opt file %s. Using default Character set.

  ER_CANT_OPEN_DB_OPT_USING_DEFAULT_CHARSET was added in 8.0.2.
- Error: 4393 SQLSTATE: HY000 (ER_CANT_CREATE_CACHE_FOR_DB_OPT)

  Message: Unable to intialize IO cache to open db.opt file %s.

  ER_CANT_CREATE_CACHE_FOR_DB_OPT was added in 8.0.2.
- Error: 4394 SQLSTATE: HY000 (ER_CANT_IDENTIFY_CHARSET_USING_DEFAULT)

  Message: Unable to identify the charset in %s. Using default character set.

  ER_CANT_IDENTIFY_CHARSET_USING_DEFAULT was added in 8.0.2.
- Error: 4395 SQLSTATE: HY000 (ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET)

  Message: db.opt file not found for %s database. Using default Character set.

  ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET was added in 8.0.2.
- Error: 4396 SQLSTATE: HY000 (ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD)

  Message: Event '%s'.'%s': invalid value in column mysql.event.time_zone.

  ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD was added in 8.0.2.
- Error: 4397 SQLSTATE: HY000 (ER_EVENT_CANT_FIND_TIMEZONE)

  Message: Event '%s'.'%s': has invalid time zone value

  ER_EVENT_CANT_FIND_TIMEZONE was added in 8.0.2.

- Error: 4398 SQLSTATE: HY000 (ER_EVENT_CANT_GET_CHARSET)

  Message: Event '%s'.'%s': invalid value in column mysql.event.character_set_client.

  ER_EVENT_CANT_GET_CHARSET was added in 8.0.2.

- Error: 4399 SQLSTATE: HY000 (ER_EVENT_CANT_GET_COLLATION)

  Message: Event '%s'.'%s': invalid value in column mysql.event.collation_connection.

  ER_EVENT_CANT_GET_COLLATION was added in 8.0.2.

- Error: 4400 SQLSTATE: HY000 (ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT)

  Message: Failed to open mysql.event Table.

  ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT was added in 8.0.2.

- Error: 4401 SQLSTATE: HY000 (ER_CANT_PARSE_STORED_ROUTINE_BODY)

  Message: Parsing '%s.%s' routine body failed. Creating routine without parsing routine body

  ER_CANT_PARSE_STORED_ROUTINE_BODY was added in 8.0.2.

- Error: 4402 SQLSTATE: HY000 (ER_CANT_OPEN_TABLE_MYSQL_PROC)

  Message: Failed to open mysql.proc Table.

  ER_CANT_OPEN_TABLE_MYSQL_PROC was added in 8.0.2.

- Error: 4403 SQLSTATE: HY000 (ER_CANT_READ_TABLE_MYSQL_PROC)

  Message: Failed to read mysql.proc table.

  ER_CANT_READ_TABLE_MYSQL_PROC was added in 8.0.2.

- Error: 4404 SQLSTATE: HY000 (ER_FILE_EXISTS_DURING_UPGRADE)

  Message: Found %s file in mysql schema. DD will create .ibd file with same name. Please rename table and start upgrade process again.

  ER_FILE_EXISTS_DURING_UPGRADE was added in 8.0.2.

- Error: 4405 SQLSTATE: HY000 (ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE)

  Message: Unable to open the data directory %s during clean up after upgrade failed

  ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE was added in 8.0.2.

- Error: 4406 SQLSTATE: HY000 (ER_CANT_SET_PATH_FOR)

  Message: Failed to set path %s

  ER_CANT_SET_PATH_FOR was added in 8.0.2.

- Error: 4407 SQLSTATE: HY000 (ER_CANT_OPEN_DIR)

  Message: Failed to open dir %s

  ER_CANT_OPEN_DIR was added in 8.0.2.

- Error: 4408 SQLSTATE: HY000 (ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

Message: NDB: Found empty nodeid specified in --ndb-cluster-connection-pool-nodeids='%s'.

ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4409 SQLSTATE: HY000 (ER_NDB_CANT_PARSE_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

  Message: NDB: Could not parse '%s' in --ndb-cluster-connection-pool-nodeids='%s'.

  ER_NDB_CANT_PARSE_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4410 SQLSTATE: HY000 (ER_NDB_INVALID_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

  Message: NDB: Invalid nodeid %d in --ndb-cluster-connection-pool-nodeids='%s'.

  ER_NDB_INVALID_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4411 SQLSTATE: HY000 (ER_NDB_DUPLICATE_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

  Message: NDB: Found duplicate nodeid %d in --ndb-cluster-connection-pool-nodeids='%s'.

  ER_NDB_DUPLICATE_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4412 SQLSTATE: HY000 (ER_NDB_POOL_SIZE_MUST_MATCH_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

  Message: NDB: The size of the cluster connection pool must be equal to the number of nodeids in --ndb-cluster-connection-pool-nodeids='%s'.

  ER_NDB_POOL_SIZE_MUST_MATCH_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4413 SQLSTATE: HY000 (ER_NDB_NODEID_NOT_FIRST_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS)

  Message: NDB: The nodeid specified by --ndb-nodeid must be equal to the first nodeid in --ndb-cluster-connection-pool-nodeids='%s'.

  ER_NDB_NODEID_NOT_FIRST_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS was added in 8.0.2.

- Error: 4414 SQLSTATE: HY000 (ER_NDB_USING_NODEID)

  Message: NDB: using nodeid %u

  ER_NDB_USING_NODEID was added in 8.0.2.

- Error: 4415 SQLSTATE: HY000 (ER_NDB_CANT_ALLOC_GLOBAL_NDB_CLUSTER_CONNECTION)

  Message: NDB: failed to allocate global ndb cluster connection

  ER_NDB_CANT_ALLOC_GLOBAL_NDB_CLUSTER_CONNECTION was added in 8.0.2.

  ER_NDB_STARTING_CONNECT_THREAD was added in 8.0.2.

- Error: 4420 SQLSTATE: HY000 (ER_NDB_NODE_INFO)

  Message: NDB[%u]: NodeID: %d, %s

  ER_NDB_NODE_INFO was added in 8.0.2.

- Error: 4421 SQLSTATE: HY000 (ER_NDB_CANT_START_CONNECT_THREAD)

  Message: NDB[%u]: failed to start connect thread

  ER_NDB_CANT_START_CONNECT_THREAD was added in 8.0.2.

- Error: 4422 SQLSTATE: HY000 (ER_NDB_GENERIC_ERROR)

  Message: NDB: error (%u) %s

  ER_NDB_GENERIC_ERROR was added in 8.0.2.

- Error: 4423 SQLSTATE: HY000 (ER_NDB_CPU_MASK_TOO_SHORT)

  Message: Ignored receive thread CPU mask, mask too short, %u CPUs needed in mask, only %u CPUs provided

  ER_NDB_CPU_MASK_TOO_SHORT was added in 8.0.2.

- Error: 4424 SQLSTATE: HY000 (ER_EVENT_ERROR_CREATING_QUERY_TO_WRITE_TO_BINLOG)

  Message: Event Error: An error occurred while creating query string, before writing it into binary log.

  ER_EVENT_ERROR_CREATING_QUERY_TO_WRITE_TO_BINLOG was added in 8.0.2.

- Error: 4425 SQLSTATE: HY000 (ER_EVENT_SCHEDULER_ERROR_LOADING_FROM_DB)

  Message: Event Scheduler: Error while loading from disk.

  ER_EVENT_SCHEDULER_ERROR_LOADING_FROM_DB was added in 8.0.2.

- Error: 4426 SQLSTATE: HY000 (ER_EVENT_SCHEDULER_ERROR_GETTING_EVENT_OBJECT)

  Message: Event Scheduler: Error getting event object.

  ER_EVENT_SCHEDULER_ERROR_GETTING_EVENT_OBJECT was added in 8.0.2.

- Error: 4427 SQLSTATE: HY000 (ER_EVENT_SCHEDULER_GOT_BAD_DATA_FROM_TABLE)

Message: Event Scheduler: Error while loading events from mysql.events.The table probably contains bad data or is corrupted

`ER_EVENT_SCHEDULER_GOT_BAD_DATA_FROM_TABLE` was added in 8.0.2.

- Error: `4428` SQLSTATE: `HY000` (`ER_EVENT_CANT_GET_LOCK_FOR_DROPPING_EVENT`)

  Message: Unable to obtain lock for dropping event %s from schema %s

  `ER_EVENT_CANT_GET_LOCK_FOR_DROPPING_EVENT` was added in 8.0.2.

- Error: `4429` SQLSTATE: `HY000` (`ER_EVENT_UNABLE_TO_DROP_EVENT`)

  Message: Unable to drop event %s from schema %s

  `ER_EVENT_UNABLE_TO_DROP_EVENT` was added in 8.0.2.

- Error: `4430` SQLSTATE: `HY000` (`ER_BINLOG_ATTACHING_THREAD_MEMORY_FINALLY_AVAILABLE`)

  Message: Server overcomes the temporary 'out of memory' in '%d' tries while attaching to session thread during the group commit phase.

  `ER_BINLOG_ATTACHING_THREAD_MEMORY_FINALLY_AVAILABLE` was added in 8.0.2.

- Error: `4431` SQLSTATE: `HY000` (`ER_BINLOG_CANT_RESIZE_CACHE`)

  Message: Unable to resize binlog IOCACHE auxiliary file

  `ER_BINLOG_CANT_RESIZE_CACHE` was added in 8.0.2.

- Error: `4432` SQLSTATE: `HY000` (`ER_BINLOG_FILE_BEING_READ_NOT_PURGED`)

  Message: file %s was not purged because it was being read by thread number %u

  `ER_BINLOG_FILE_BEING_READ_NOT_PURGED` was added in 8.0.2.

- Error: `4433` SQLSTATE: `HY000` (`ER_BINLOG_IO_ERROR_READING_HEADER`)

  Message: I/O error reading the header from the binary log, errno=%d, io cache code=%d

  `ER_BINLOG_IO_ERROR_READING_HEADER` was added in 8.0.2.

- Error: `4434` SQLSTATE: `HY000` (`ER_BINLOG_CANT_OPEN_LOG`)

  Message: Failed to open log (file '%s', errno %d)

  `ER_BINLOG_CANT_OPEN_LOG` was added in 8.0.2.

- Error: `4435` SQLSTATE: `HY000` (`ER_BINLOG_CANT_CREATE_CACHE_FOR_LOG`)

  Message: Failed to create a cache on log (file '%s')

  `ER_BINLOG_CANT_CREATE_CACHE_FOR_LOG` was added in 8.0.2.

- Error: `4436` SQLSTATE: `HY000` (`ER_BINLOG_FILE_EXTENSION_NUMBER_EXHAUSTED`)

  Message: Log filename extension number exhausted: %06lu. Please fix this by archiving old logs and updating the index files.

  `ER_BINLOG_FILE_EXTENSION_NUMBER_EXHAUSTED` was added in 8.0.2.

- Error: `4437` SQLSTATE: `HY000` (`ER_BINLOG_FILE_NAME_TOO_LONG`)

Message: Log filename too large: %s%s (%zu). Please fix this by archiving old logs and updating the index files.

ER_BINLOG_FILE_NAME_TOO_LONG was added in 8.0.2.

- Error: 4438 SQLSTATE: HY000 (ER_BINLOG_FILE_EXTENSION_NUMBER_RUNNING_LOW)

  Message: Next log extension: %lu. Remaining log filename extensions: %lu. Please consider archiving some logs.

  ER_BINLOG_FILE_EXTENSION_NUMBER_RUNNING_LOW was added in 8.0.2.

- Error: 4439 SQLSTATE: HY000 (ER_BINLOG_CANT_OPEN_FOR_LOGGING)

  Message: Could not open %s for logging (error %d). Turning logging off for the whole duration of the MySQL server process. To turn it on again: fix the cause, shutdown the MySQL server and restart it.

  ER_BINLOG_CANT_OPEN_FOR_LOGGING was added in 8.0.2.

- Error: 4440 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_SYNC_INDEX_FILE)

  Message: MYSQL_BIN_LOG::open_index_file failed to sync the index file.

  ER_BINLOG_FAILED_TO_SYNC_INDEX_FILE was added in 8.0.2.

- Error: 4441 SQLSTATE: HY000 (ER_BINLOG_ERROR_READING_GTIDS_FROM_RELAY_LOG)

  Message: Error reading GTIDs from relaylog: %d

  ER_BINLOG_ERROR_READING_GTIDS_FROM_RELAY_LOG was added in 8.0.2.

- Error: 4442 SQLSTATE: HY000 (ER_BINLOG_EVENTS_READ_FROM_RELAY_LOG_INFO)

  Message: %lu events read in relaylog file '%s' for updating Retrieved_Gtid_Set and/or IO thread transaction parser state.

  ER_BINLOG_EVENTS_READ_FROM_RELAY_LOG_INFO was added in 8.0.2.

- Error: 4443 SQLSTATE: HY000 (ER_BINLOG_ERROR_READING_GTIDS_FROM_BINARY_LOG)

  Message: Error reading GTIDs from binary log: %d

  ER_BINLOG_ERROR_READING_GTIDS_FROM_BINARY_LOG was added in 8.0.2.

- Error: 4444 SQLSTATE: HY000 (ER_BINLOG_EVENTS_READ_FROM_BINLOG_INFO)

  Message: Read %lu events from binary log file '%s' to determine the GTIDs purged from binary logs.

  ER_BINLOG_EVENTS_READ_FROM_BINLOG_INFO was added in 8.0.2.

- Error: 4445 SQLSTATE: HY000 (ER_BINLOG_CANT_GENERATE_NEW_FILE_NAME)

  Message: MYSQL_BIN_LOG::open failed to generate new file name.

  ER_BINLOG_CANT_GENERATE_NEW_FILE_NAME was added in 8.0.2.

- Error: 4446 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_SYNC_INDEX_FILE_IN_OPEN)

  Message: MYSQL_BIN_LOG::open failed to sync the index file.

  ER_BINLOG_FAILED_TO_SYNC_INDEX_FILE_IN_OPEN was added in 8.0.2.

- Error: 4447 SQLSTATE: HY000 (ER_BINLOG_CANT_USE_FOR_LOGGING)

Message: Could not use %s for logging (error %d). Turning logging off for the whole duration of the MySQL server process. To turn it on again: fix the cause, shutdown the MySQL server and restart it.

`ER_BINLOG_CANT_USE_FOR_LOGGING` was added in 8.0.2.

- Error: `4448` SQLSTATE: `HY000` (`ER_BINLOG_FAILED_TO_CLOSE_INDEX_FILE_WHILE_REBUILDING`)

  Message: While rebuilding index file %s: Failed to close the index file.

  `ER_BINLOG_FAILED_TO_CLOSE_INDEX_FILE_WHILE_REBUILDING` was added in 8.0.2.

- Error: `4449` SQLSTATE: `HY000` (`ER_BINLOG_FAILED_TO_DELETE_INDEX_FILE_WHILE_REBUILDING`)

  Message: While rebuilding index file %s: Failed to delete the existing index file. It could be that file is being used by some other process.

  `ER_BINLOG_FAILED_TO_DELETE_INDEX_FILE_WHILE_REBUILDING` was added in 8.0.2.

- Error: `4450` SQLSTATE: `HY000` (`ER_BINLOG_FAILED_TO_RENAME_INDEX_FILE_WHILE_REBUILDING`)

  Message: While rebuilding index file %s: Failed to rename the new index file to the existing index file.

  `ER_BINLOG_FAILED_TO_RENAME_INDEX_FILE_WHILE_REBUILDING` was added in 8.0.2.

- Error: `4451` SQLSTATE: `HY000` (`ER_BINLOG_FAILED_TO_OPEN_INDEX_FILE_AFTER_REBUILDING`)

  Message: After rebuilding the index file %s: Failed to open the index file.

  `ER_BINLOG_FAILED_TO_OPEN_INDEX_FILE_AFTER_REBUILDING` was added in 8.0.2.

- Error: `4452` SQLSTATE: `HY000` (`ER_BINLOG_CANT_APPEND_LOG_TO_TMP_INDEX`)

  Message: MYSQL_BIN_LOG::add_log_to_index failed to append log file name: %s, to crash safe index file.

  `ER_BINLOG_CANT_APPEND_LOG_TO_TMP_INDEX` was added in 8.0.2.

- Error: `4453` SQLSTATE: `HY000` (`ER_BINLOG_CANT_LOCATE_OLD_BINLOG_OR_RELAY_LOG_FILES`)

  Message: Failed to locate old binlog or relay log files

  `ER_BINLOG_CANT_LOCATE_OLD_BINLOG_OR_RELAY_LOG_FILES` was added in 8.0.2.

- Error: `4454` SQLSTATE: `HY000` (`ER_BINLOG_CANT_DELETE_FILE`)

  Message: Failed to delete file '%s'

  `ER_BINLOG_CANT_DELETE_FILE` was added in 8.0.2.

- Error: `4455` SQLSTATE: `HY000` (`ER_BINLOG_CANT_SET_TMP_INDEX_NAME`)

  Message: MYSQL_BIN_LOG::set_crash_safe_index_file_name failed to set file name.

  `ER_BINLOG_CANT_SET_TMP_INDEX_NAME` was added in 8.0.2.

- Error: `4456` SQLSTATE: `HY000` (`ER_BINLOG_FAILED_TO_OPEN_TEMPORARY_INDEX_FILE`)

  Message: MYSQL_BIN_LOG::open_crash_safe_index_file failed to open temporary index file.

ER_BINLOG_FAILED_TO_OPEN_TEMPORARY_INDEX_FILE was added in 8.0.2.

- Error: 4457 SQLSTATE: HY000 (ER_BINLOG_ERROR_GETTING_NEXT_LOG_FROM_INDEX)

  Message: next log error: %d offset: %s log: %s included: %d

  ER_BINLOG_ERROR_GETTING_NEXT_LOG_FROM_INDEX was added in 8.0.2.

- Error: 4458 SQLSTATE: HY000 (ER_BINLOG_CANT_OPEN_TMP_INDEX)

  Message: %s failed to open the crash safe index file.

  ER_BINLOG_CANT_OPEN_TMP_INDEX was added in 8.0.2.

- Error: 4459 SQLSTATE: HY000 (ER_BINLOG_CANT_COPY_INDEX_TO_TMP)

  Message: %s failed to copy index file to crash safe index file.

  ER_BINLOG_CANT_COPY_INDEX_TO_TMP was added in 8.0.2.

- Error: 4460 SQLSTATE: HY000 (ER_BINLOG_CANT_CLOSE_TMP_INDEX)

  Message: %s failed to close the crash safe index file.

  ER_BINLOG_CANT_CLOSE_TMP_INDEX was added in 8.0.2.

- Error: 4461 SQLSTATE: HY000 (ER_BINLOG_CANT_MOVE_TMP_TO_INDEX)

  Message: %s failed to move crash safe index file to index file.

  ER_BINLOG_CANT_MOVE_TMP_TO_INDEX was added in 8.0.2.

- Error: 4462 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_CALLED_WITH_FILE_NOT_IN_INDEX)

  Message: MYSQL_BIN_LOG::purge_logs was called with file %s not listed in the index.

  ER_BINLOG_PURGE_LOGS_CALLED_WITH_FILE_NOT_IN_INDEX was added in 8.0.2.

- Error: 4463 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_CANT_SYNC_INDEX_FILE)

  Message: MYSQL_BIN_LOG::purge_logs failed to sync the index file.

  ER_BINLOG_PURGE_LOGS_CANT_SYNC_INDEX_FILE was added in 8.0.2.

- Error: 4464 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_CANT_COPY_TO_REGISTER_FILE)

  Message: MYSQL_BIN_LOG::purge_logs failed to copy %s to register file.

  ER_BINLOG_PURGE_LOGS_CANT_COPY_TO_REGISTER_FILE was added in 8.0.2.

- Error: 4465 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_CANT_FLUSH_REGISTER_FILE)

  Message: MYSQL_BIN_LOG::purge_logs failed to flush register file.

  ER_BINLOG_PURGE_LOGS_CANT_FLUSH_REGISTER_FILE was added in 8.0.2.

- Error: 4466 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_CANT_UPDATE_INDEX_FILE)

  Message: MYSQL_BIN_LOG::purge_logs failed to update the index file

  ER_BINLOG_PURGE_LOGS_CANT_UPDATE_INDEX_FILE was added in 8.0.2.

- Error: 4467 SQLSTATE: HY000 (ER_BINLOG_PURGE_LOGS_FAILED_TO_PURGE_LOG)

Message: MYSQL_BIN_LOG::purge_logs failed to process registered files that would be purged.

ER_BINLOG_PURGE_LOGS_FAILED_TO_PURGE_LOG was added in 8.0.2.

- Error: 4468 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_SET_PURGE_INDEX_FILE_NAME)

  Message: MYSQL_BIN_LOG::set_purge_index_file_name failed to set file name.

  ER_BINLOG_FAILED_TO_SET_PURGE_INDEX_FILE_NAME was added in 8.0.2.

- Error: 4469 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_OPEN_REGISTER_FILE)

  Message: MYSQL_BIN_LOG::open_purge_index_file failed to open register file.

  ER_BINLOG_FAILED_TO_OPEN_REGISTER_FILE was added in 8.0.2.

- Error: 4470 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_REINIT_REGISTER_FILE)

  Message: MYSQL_BIN_LOG::purge_index_entry failed to reinit register file for read

  ER_BINLOG_FAILED_TO_REINIT_REGISTER_FILE was added in 8.0.2.

- Error: 4471 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_READ_REGISTER_FILE)

  Message: MYSQL_BIN_LOG::purge_index_entry error %d reading from register file.

  ER_BINLOG_FAILED_TO_READ_REGISTER_FILE was added in 8.0.2.

- Error: 4472 SQLSTATE: HY000 (ER_CANT_STAT_FILE)

  Message: Failed to execute mysql_file_stat on file '%s'

  ER_CANT_STAT_FILE was added in 8.0.2.

- Error: 4473 SQLSTATE: HY000 (ER_BINLOG_CANT_DELETE_LOG_FILE_DOES_INDEX_MATCH_FILES)

  Message: Failed to delete log file '%s'; consider examining correspondence of your binlog index file to the actual binlog files

  ER_BINLOG_CANT_DELETE_LOG_FILE_DOES_INDEX_MATCH_FILES was added in 8.0.2.

- Error: 4474 SQLSTATE: HY000 (ER_BINLOG_CANT_DELETE_FILE_AND_READ_BINLOG_INDEX)

  Message: Failed to delete file '%s' and read the binlog index file

  ER_BINLOG_CANT_DELETE_FILE_AND_READ_BINLOG_INDEX was added in 8.0.2.

- Error: 4475 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_DELETE_LOG_FILE)

  Message: Failed to delete log file '%s'

  ER_BINLOG_FAILED_TO_DELETE_LOG_FILE was added in 8.0.2.

- Error: 4476 SQLSTATE: HY000 (ER_BINLOG_LOGGING_INCIDENT_TO_STOP_SLAVES)

  Message: %s An incident event has been written to the binary log which will stop the slaves.

  ER_BINLOG_LOGGING_INCIDENT_TO_STOP_SLAVES was added in 8.0.2.

- Error: 4477 SQLSTATE: HY000 (ER_BINLOG_CANT_FIND_LOG_IN_INDEX)

  Message: find_log_pos() failed (error: %d)

ER_BINLOG_CANT_FIND_LOG_IN_INDEX was added in 8.0.2.

- Error: 4478 SQLSTATE: HY000 (ER_BINLOG_RECOVERING_AFTER_CRASH_USING)

  Message: Recovering after a crash using %s

  ER_BINLOG_RECOVERING_AFTER_CRASH_USING was added in 8.0.2.

- Error: 4479 SQLSTATE: HY000 (ER_BINLOG_CANT_OPEN_CRASHED_BINLOG)

  Message: Failed to open the crashed binlog file when master server is recovering it.

  ER_BINLOG_CANT_OPEN_CRASHED_BINLOG was added in 8.0.2.

- Error: 4480 SQLSTATE: HY000 (ER_BINLOG_CANT_TRIM_CRASHED_BINLOG)

  Message: Failed to trim the crashed binlog file when master server is recovering it.

  ER_BINLOG_CANT_TRIM_CRASHED_BINLOG was added in 8.0.2.

- Error: 4481 SQLSTATE: HY000 (ER_BINLOG_CRASHED_BINLOG_TRIMMED)

  Message: Crashed binlog file %s size is %llu, but recovered up to %llu. Binlog trimmed to %llu bytes.

  ER_BINLOG_CRASHED_BINLOG_TRIMMED was added in 8.0.2.

- Error: 4482 SQLSTATE: HY000 (ER_BINLOG_CANT_CLEAR_IN_USE_FLAG_FOR_CRASHED_BINLOG)

  Message: Failed to clear LOG_EVENT_BINLOG_IN_USE_F for the crashed binlog file when master server is recovering it.

  ER_BINLOG_CANT_CLEAR_IN_USE_FLAG_FOR_CRASHED_BINLOG was added in 8.0.2.

- Error: 4483 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_RUN_AFTER_SYNC_HOOK)

  Message: Failed to run 'after_sync' hooks

  ER_BINLOG_FAILED_TO_RUN_AFTER_SYNC_HOOK was added in 8.0.2.

- Error: 4484 SQLSTATE: HY000 (ER_TURNING_LOGGING_OFF_FOR_THE_DURATION)

  Message: %s Hence turning logging off for the whole duration of the MySQL server process. To turn it on again: fix the cause, shutdown the MySQL server and restart it.

  ER_TURNING_LOGGING_OFF_FOR_THE_DURATION was added in 8.0.2.

- Error: 4485 SQLSTATE: HY000 (ER_BINLOG_FAILED_TO_RUN_AFTER_FLUSH_HOOK)

  Message: Failed to run 'after_flush' hooks

  ER_BINLOG_FAILED_TO_RUN_AFTER_FLUSH_HOOK was added in 8.0.2.

- Error: 4486 SQLSTATE: HY000 (ER_BINLOG_CRASH_RECOVERY_FAILED)

  Message: Crash recovery failed. Either correct the problem (if it's, for example, out of memory error) and restart, or delete (or rename) binary log and start mysqld with --tc-heuristic-recover={commit|rollback}

  ER_BINLOG_CRASH_RECOVERY_FAILED was added in 8.0.2.

- Error: 4487 SQLSTATE: HY000 (ER_BINLOG_WARNING_SUPPRESSED)

Message: The following warning was suppressed %d times during the last %d seconds in the error log

`ER_BINLOG_WARNING_SUPPRESSED` was added in 8.0.2.

- Error: `4488` SQLSTATE: `HY000` (`ER_NDB_LOG_ENTRY`)

  Message: NDB: %s

  `ER_NDB_LOG_ENTRY` was added in 8.0.2.

  Message: Build InnoDB index translation table for Table %s failed

  `ER_INNODB_CANT_BUILD_INDEX_XLATION_TABLE_FOR` was added in 8.0.2.

- Error: `4506` SQLSTATE: `HY000` (`ER_INNODB_PK_NOT_IN_MYSQL`)

  Message: Table %s has a primary key in InnoDB data dictionary, but not in MySQL!

  `ER_INNODB_PK_NOT_IN_MYSQL` was added in 8.0.2.

- Error: `4507` SQLSTATE: `HY000` (`ER_INNODB_PK_ONLY_IN_MYSQL`)

Message: Table %s has no primary key in InnoDB data dictionary, but has one in MySQL! If you created the table with a MySQL version < 3.23.54 and did not define a primary key, but defined a unique key with all non-NULL columns, then MySQL internally treats that key as the primary key. You can fix this error by dump + DROP + CREATE + reimport of the table.

`ER_INNODB_PK_ONLY_IN_MYSQL` was added in 8.0.2.

- Error: `4508` SQLSTATE: `HY000` (`ER_INNODB_CLUSTERED_INDEX_PRIVATE`)

  Message: Table %s key_used_on_scan is %lu even though there is no primary key inside InnoDB.

  `ER_INNODB_CLUSTERED_INDEX_PRIVATE` was added in 8.0.2.

- Error: `4509` SQLSTATE: `HY000` (`ER_INNODB_PARTITION_TABLE_LOWERCASED`)

  Message: Partition table %s opened after converting to lower case. The table may have been moved from a case in-sensitive file system. Please recreate table in the current file system

  `ER_INNODB_PARTITION_TABLE_LOWERCASED` was added in 8.0.2.

- Error: `4510` SQLSTATE: `HY000` (`ER_ERRMSG_REPLACEMENT_DODGY`)

  Message: Cannot replace error message (%s,%s,%s) "%s" with "%s"; wrong number or type of %% subsitutions.

  `ER_ERRMSG_REPLACEMENT_DODGY` was added in 8.0.2.

- Error: `4511` SQLSTATE: `HY000` (`ER_ERRMSG_REPLACEMENTS_FAILED`)

  Message: Table for error message replacements could not be found or read, or one or more replacements could not be applied.

  `ER_ERRMSG_REPLACEMENTS_FAILED` was added in 8.0.2.

- Error: `4512` SQLSTATE: `HY000` (`ER_NPIPE_CANT_CREATE`)

  Message: %s: %s

  `ER_NPIPE_CANT_CREATE` was added in 8.0.2.

- Error: `4513` SQLSTATE: `HY000` (`ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX`)

  Message: Table '%s': Delete from part %d failed with error %d. But it was already inserted into part %d, when moving the misplaced row! Please manually fix the duplicate row: %s

  `ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX` was added in 8.0.2.

- Error: `4514` SQLSTATE: `HY000` (`ER_AUDIT_CANT_ABORT_COMMAND`)

  Message: Command '%s' cannot be aborted. The trigger error was (%d) [%s]: %s

  `ER_AUDIT_CANT_ABORT_COMMAND` was added in 8.0.2.

- Error: `4515` SQLSTATE: `HY000` (`ER_AUDIT_CANT_ABORT_EVENT`)

  Message: Event '%s' cannot be aborted. The trigger error was (%d) [%s]: %s

  `ER_AUDIT_CANT_ABORT_EVENT` was added in 8.0.2.

- Error: `4516` SQLSTATE: `HY000` (`ER_AUDIT_WARNING`)

  Message: %s. The trigger error was (%d) [%s]: %s

ER_AUDIT_WARNING was added in 8.0.2.

- Error: 4517 SQLSTATE: HY000 (ER_NDB_NUMBER_OF_CHANNELS)

  Message: Slave SQL: Configuration with number of replication masters = %u' is not supported when applying to Ndb

  ER_NDB_NUMBER_OF_CHANNELS was added in 8.0.2.

- Error: 4518 SQLSTATE: HY000 (ER_NDB_SLAVE_PARALLEL_WORKERS)

  Message: Slave SQL: Configuration 'slave_parallel_workers = %lu' is not supported when applying to Ndb

  ER_NDB_SLAVE_PARALLEL_WORKERS was added in 8.0.2.

- Error: 4519 SQLSTATE: HY000 (ER_NDB_DISTRIBUTING_ERR)

  Message: NDB %s: distributing %s err: %u

  ER_NDB_DISTRIBUTING_ERR was added in 8.0.2.

- Error: 4520 SQLSTATE: HY000 (ER_PART_EXPR_TOO_LONG)

  Message: Partitioning expression is too long.

  ER_PART_EXPR_TOO_LONG was added in 8.0.2.

- Error: 4521 SQLSTATE: HY000 (ER_UDF_DROP_DYNAMICALLY_REGISTERED)

  Message: DROP FUNCTION can't drop a dynamically registered user defined function

  ER_UDF_DROP_DYNAMICALLY_REGISTERED was added in 8.0.2.

- Error: 4522 SQLSTATE: HY000 (ER_UNABLE_TO_STORE_COLUMN_STATISTICS)

  Message: Unable to store column statistics for column '%s' in table '%s'.'%s'

  ER_UNABLE_TO_STORE_COLUMN_STATISTICS was added in 8.0.2.

- Error: 4523 SQLSTATE: HY000 (ER_UNABLE_TO_UPDATE_COLUMN_STATISTICS)

  Message: Unable to update column statistics for column '%s' in table '%s'.'%s'

  ER_UNABLE_TO_UPDATE_COLUMN_STATISTICS was added in 8.0.2.

- Error: 4524 SQLSTATE: HY000 (ER_UNABLE_TO_DROP_COLUMN_STATISTICS)

  Message: Unable to remove column statistics for column '%s' in table '%s'.'%s'

  ER_UNABLE_TO_DROP_COLUMN_STATISTICS was added in 8.0.2.

- Error: 4525 SQLSTATE: HY000 (ER_UNABLE_TO_BUILD_HISTOGRAM)

  Message: Unable to build histogram statistics for column '%s' in table '%s'.'%s'

  ER_UNABLE_TO_BUILD_HISTOGRAM was added in 8.0.2.

- Error: 4526 SQLSTATE: HY000 (ER_STOP_SLAVE_IO_THREAD_DISK_SPACE)

  Message: Waiting until I/O thread for channel '%s' finish writing to disk before stopping. Free some disk space or use 'KILL' to abort I/O thread operation. Notice that aborting the I/O thread while rotating the relay log might corrupt the relay logs, requiring a server restart to fix it.

ER_STOP_SLAVE_IO_THREAD_DISK_SPACE was added in 8.0.2.

- Error: 4527 SQLSTATE: HY000 (ER_MANDATORY_ROLE)

  Message: The role %s is a mandatory role and can't be revoked or dropped. The restriction can be lifted by excluding the role identifier from the global variable mandatory_roles.

  ER_MANDATORY_ROLE was added in 8.0.2.

- Error: 4528 SQLSTATE: HY000 (ER_MISSING_TABLESPACE_FILE)

  Message: Tablespace '%s' does not have a file named '%s'

  ER_MISSING_TABLESPACE_FILE was added in 8.0.3.

- Error: 4529 SQLSTATE: 42000 (ER_PERSIST_ONLY_ACCESS_DENIED_ERROR)

  Message: Access denied; you need %s privileges for this operation

  ER_PERSIST_ONLY_ACCESS_DENIED_ERROR was added in 8.0.3.

- Error: 4530 SQLSTATE: HY000 (ER_CMD_NEED_SUPER)

  Message: You need the SUPER privilege for command '%s'

  ER_CMD_NEED_SUPER was added in 8.0.3.

- Error: 4531 SQLSTATE: HY000 (ER_PATH_IN_DATADIR)

  Message: Path is within the current data directory '%s'

  ER_PATH_IN_DATADIR was added in 8.0.3.

- Error: 4532 SQLSTATE: HY000 (ER_DDL_IN_PROGRESS)

  Message: Concurrent DDL is performed during the operation. Please try again.

  ER_DDL_IN_PROGRESS was added in 8.0.3.

- Error: 4533 SQLSTATE: HY000 (ER_TOO_MANY_CONCURRENT_CLONES)

  Message: Too many concurrent clone operations. Maximum allowed - %d.

  ER_TOO_MANY_CONCURRENT_CLONES was added in 8.0.3.

- Error: 4534 SQLSTATE: HY000 (ER_SDI_OPERATION_FAILED)

  Message: Failed to %s SDI '%s.%s' in tablespace '%s'.

  ER_SDI_OPERATION_FAILED was added in 8.0.3, removed after 8.0.3.

- Error: 4534 SQLSTATE: HY000 (ER_APPLIER_LOG_EVENT_VALIDATION_ERROR)

  Message: The table in transaction %s does not comply with the requirements by an external plugin.

  ER_APPLIER_LOG_EVENT_VALIDATION_ERROR was added in 8.0.3.

- Error: 4535 SQLSTATE: HY000 (ER_CTE_MAX_RECURSION_DEPTH)

  Message: Recursive query aborted after %u iterations. Try increasing @@cte_max_recursion_depth to a larger value.

  ER_CTE_MAX_RECURSION_DEPTH was added in 8.0.3.

- Error: 4536 SQLSTATE: HY000 (ER_NOT_HINT_UPDATABLE_VARIABLE)

  Message: Variable %s cannot be set using SET_VAR hint.

  ER_NOT_HINT_UPDATABLE_VARIABLE was added in 8.0.3.

- Error: 4537 SQLSTATE: HY000 (ER_CREDENTIALS_CONTRADICT_TO_HISTORY)

  Message: Cannot use these credentials for '%.*s@%.*s' because they contradict the password history policy

  ER_CREDENTIALS_CONTRADICT_TO_HISTORY was added in 8.0.3.

- Error: 4538 SQLSTATE: HY000 (ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID)

  Message: Non-zero password history clauses ignored for user '%s'@'%s' as its authentication plugin %s does not support password history

  ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID was added in 8.0.3.

- Error: 4539 SQLSTATE: HY000 (ER_CLIENT_DOES_NOT_SUPPORT)

  Message: The client doesn't support %s

  ER_CLIENT_DOES_NOT_SUPPORT was added in 8.0.3.

- Error: 4540 SQLSTATE: HY000 (ER_I_S_SKIPPED_TABLESPACE)

  Message: Tablespace '%s' was skipped since its definition is being modified by concurrent DDL statement

  ER_I_S_SKIPPED_TABLESPACE was added in 8.0.3.

- Error: 4541 SQLSTATE: HY000 (ER_TABLESPACE_ENGINE_MISMATCH)

  Message: Engine '%s' does not match stored engine '%s' for tablespace '%s'

  ER_TABLESPACE_ENGINE_MISMATCH was added in 8.0.3.

- Error: 4542 SQLSTATE: HY000 (ER_RPL_CANT_HAVE_SAME_BASENAME)

  Message: Cannot have same base name '%s' for both binary and relay logs. Please check %s (default '%s') and %s (default '%s') options to ensure they do not conflict

  ER_RPL_CANT_HAVE_SAME_BASENAME was added in 8.0.4.

- Error: 4543 SQLSTATE: HY000 (ER_WARN_NO_SERVERID_SPECIFIED)

  Message: You have not provided a mandatory server-id. Servers in a replication topology must have unique server-ids. Please refer to the proper server start-up parameters documentation.

  ER_WARN_NO_SERVERID_SPECIFIED was added in 8.0.4.

- Error: 4544 SQLSTATE: HY000 (ER_WRONG_SRID_FOR_COLUMN)

  Message: The SRID of the geometry does not match the SRID of the column '%s'. The SRID of the geometry is %lu, but the SRID of the column is %lu. Consider changing the SRID of the geometry or the SRID property of the column.

  ER_WRONG_SRID_FOR_COLUMN was added in 8.0.4.

- Error: 4545 SQLSTATE: HY000 (ER_CANNOT_ALTER_SRID_DUE_TO_INDEX)

Message: The SRID specification on the column '%s' cannot be changed because there is a spatial index on the column. Please remove the spatial index before altering the SRID specification.

`ER_CANNOT_ALTER_SRID_DUE_TO_INDEX` was added in 8.0.4.

- Error: `4546` SQLSTATE: `HY000` (`ER_WARN_BINLOG_PARTIAL_UPDATES_DISABLED`)

  Message: When %s, the option binlog_row_value_options=%s will be ignored and updates will be written in full format to binary log.

  `ER_WARN_BINLOG_PARTIAL_UPDATES_DISABLED` was added in 8.0.4.

- Error: `4547` SQLSTATE: `HY000` (`ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED`)

  Message: When %s, the option log_bin_use_v1_row_events=1 will be ignored and row events will be written in new format to binary log.

  `ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED` was added in 8.0.4.

- Error: `4548` SQLSTATE: `HY000` (`ER_WARN_BINLOG_PARTIAL_UPDATES_SUGGESTS_PARTIAL_IMAGES`)

  Message: When %s, the option binlog_row_value_options=%s will be used only for the after-image. Full values will be written in the before-image, so the saving in disk space due to binlog_row_value_options is limited to less than 50%%.

  `ER_WARN_BINLOG_PARTIAL_UPDATES_SUGGESTS_PARTIAL_IMAGES` was added in 8.0.4.

- Error: `4549` SQLSTATE: `HY000` (`ER_COULD_NOT_APPLY_JSON_DIFF`)

  Message: Could not apply JSON diff in table %.*s, column %s.

  `ER_COULD_NOT_APPLY_JSON_DIFF` was added in 8.0.4.

- Error: `4550` SQLSTATE: `HY000` (`ER_CORRUPTED_JSON_DIFF`)

  Message: Corrupted JSON diff for table %.*s, column %s.

  `ER_CORRUPTED_JSON_DIFF` was added in 8.0.4.

- Error: `4551` SQLSTATE: `HY000` (`ER_RESOURCE_GROUP_EXISTS`)

  Message: Resource Group '%s' exists

  `ER_RESOURCE_GROUP_EXISTS` was added in 8.0.4.

- Error: `4552` SQLSTATE: `HY000` (`ER_RESOURCE_GROUP_NOT_EXISTS`)

  Message: Resource Group '%s' does not exist.

  `ER_RESOURCE_GROUP_NOT_EXISTS` was added in 8.0.4.

- Error: `4553` SQLSTATE: `HY000` (`ER_INVALID_VCPU_ID`)

  Message: Invalid cpu id %u

  `ER_INVALID_VCPU_ID` was added in 8.0.4.

- Error: `4554` SQLSTATE: `HY000` (`ER_INVALID_VCPU_RANGE`)

  Message: Invalid VCPU range %u-%u

  `ER_INVALID_VCPU_RANGE` was added in 8.0.4.

- Error: 4555 SQLSTATE: HY000 (ER_INVALID_THREAD_PRIORITY)

  Message: Invalid thread priority value %d for %s resource group %s. Allowed range is [%d, %d].

  ER_INVALID_THREAD_PRIORITY was added in 8.0.4.

- Error: 4556 SQLSTATE: HY000 (ER_DISALLOWED_OPERATION)

  Message: %s operation is disallowed on %s

  ER_DISALLOWED_OPERATION was added in 8.0.4.

- Error: 4557 SQLSTATE: HY000 (ER_RESOURCE_GROUP_BUSY)

  Message: Resource group %s is busy.

  ER_RESOURCE_GROUP_BUSY was added in 8.0.4.

- Error: 4558 SQLSTATE: HY000 (ER_RESOURCE_GROUP_DISABLED)

  Message: Resource group %s is disabled.

  ER_RESOURCE_GROUP_DISABLED was added in 8.0.4.

- Error: 4559 SQLSTATE: HY000 (ER_FEATURE_UNSUPPORTED)

  Message: Feature %s is unsupported (%s).

  ER_FEATURE_UNSUPPORTED was added in 8.0.4.

- Error: 4560 SQLSTATE: HY000 (ER_ATTRIBUTE_IGNORED)

  Message: Attribute %s is ignored (%s).

  ER_ATTRIBUTE_IGNORED was added in 8.0.4.

- Error: 4561 SQLSTATE: HY000 (ER_INVALID_THREAD_ID)

  Message: Invalid thread id (%llu).

  ER_INVALID_THREAD_ID was added in 8.0.4.

- Error: 4562 SQLSTATE: HY000 (ER_RESOURCE_GROUP_BIND_FAILED)

  Message: Unable to bind resource group %s with thread id (%llu).(%s).

  ER_RESOURCE_GROUP_BIND_FAILED was added in 8.0.4.

- Error: 4563 SQLSTATE: HY000 (ER_INVALID_USE_OF_FORCE_OPTION)

  Message: Option FORCE invalid as DISABLE option is not specified.

  ER_INVALID_USE_OF_FORCE_OPTION was added in 8.0.4.

- Error: 4564 SQLSTATE: HY000 (ER_GROUP_REPLICATION_COMMAND_FAILURE)

  Message: The %s command encountered a failure. %s

  ER_GROUP_REPLICATION_COMMAND_FAILURE was added in 8.0.4.

B.4 Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `2000` (`CR_UNKNOWN_ERROR`)

  Message: Unknown MySQL error
- Error: `2001` (`CR_SOCKET_CREATE_ERROR`)

  Message: Can't create UNIX socket (%d)
- Error: `2002` (`CR_CONNECTION_ERROR`)

  Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: `2003` (`CR_CONN_HOST_ERROR`)

  Message: Can't connect to MySQL server on '%s' (%d)
- Error: `2004` (`CR_IPSOCK_ERROR`)

  Message: Can't create TCP/IP socket (%d)
- Error: `2005` (`CR_UNKNOWN_HOST`)

  Message: Unknown MySQL server host '%s' (%d)
- Error: `2006` (`CR_SERVER_GONE_ERROR`)

  Message: MySQL server has gone away
- Error: `2007` (`CR_VERSION_ERROR`)

  Message: Protocol mismatch; server version = %d, client version = %d
- Error: `2008` (`CR_OUT_OF_MEMORY`)

  Message: MySQL client ran out of memory
- Error: `2009` (`CR_WRONG_HOST_INFO`)

  Message: Wrong host info
- Error: `2010` (`CR_LOCALHOST_CONNECTION`)

  Message: Localhost via UNIX socket
- Error: `2011` (`CR_TCP_CONNECTION`)

  Message: %s via TCP/IP
- Error: `2012` (`CR_SERVER_HANDSHAKE_ERR`)

  Message: Error in server handshake
- Error: `2013` (`CR_SERVER_LOST`)

Message: Lost connection to MySQL server during query

- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

  Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR_NAMEDPIPE_CONNECTION)

  Message: Named pipe: %s

- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)

  Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)

  Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)

  Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)

  Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR_NET_PACKET_TOO_LARGE)

  Message: Got packet bigger than 'max_allowed_packet' bytes

- Error: 2021 (CR_EMBEDDED_CONNECTION)

  Message: Embedded server

- Error: 2022 (CR_PROBE_SLAVE_STATUS)

  Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

  Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR_PROBE_SLAVE_CONNECT)

  Message: Error connecting to slave:

- Error: 2025 (CR_PROBE_MASTER_CONNECT)

  Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

  Message: SSL connection error: %s

- Error: 2027 (CR_MALFORMED_PACKET)

  Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

  Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

  Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

  Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

  Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

  Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

  Message: Invalid parameter number

  The column number for `mysql_stmt_fetch_column()` was invalid.

  The parameter number for `mysql_stmt_send_long_data()` was invalid.

  A key name was empty or the amount of connection attribute data for `mysql_options4()` exceeds the 64KB limit.

- Error: 2035 (CR_INVALID_BUFFER_USE)

  Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

  Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

  Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

  Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

  Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

  Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

  Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

  Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

  Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

  Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

  Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

  Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

  Message: Wrong or unknown protocol

- Error: 2048 (CR_INVALID_CONN_HANDLE)

  Message: Invalid connection handle

- Error: 2049 (CR_UNUSED_1)

  Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: 2050 (CR_FETCH_CANCELED)

  Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: 2051 (CR_NO_DATA)

  Message: Attempt to read column without prior row fetch

- Error: 2052 (CR_NO_STMT_METADATA)

  Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET)

  Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)

  Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

  Message: Lost connection to MySQL server at '%s', system error: %d

- Error: 2056 (CR_STMT_CLOSED)

  Message: Statement closed indirectly because of a preceding %s() call

- Error: 2057 (CR_NEW_STMT_METADATA)

  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again

- Error: 2058 (CR_ALREADY_CONNECTED)

  Message: This handle is already connected. Use a separate handle for each connection.

- Error: 2059 (CR_AUTH_PLUGIN_CANNOT_LOAD)

  Message: Authentication plugin '%s' cannot be loaded: %s

- Error: 2060 (CR_DUPLICATE_CONNECTION_ATTR)

  Message: There is an attribute with the same name already

  A duplicate connection attribute name was specified for mysql_options4().

- Error: 2061 (CR_AUTH_PLUGIN_ERR)

  Message: Authentication plugin '%s' reported error: %s

- Error: 2062 (CR_INSECURE_API_ERR)

  Message: Insecure API function call: '%s' Use instead: '%s'

  An insecure function call was detected. Modify the application to use the suggested alternative function instead.

- Error: 2063 (CR_FILE_NAME_TOO_LONG)

  Message: File name is too long

  CR_FILE_NAME_TOO_LONG was added in 8.0.1.

B.5 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.5.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

  In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as glibc) are up to date.

  It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing kbd_mode -a.

- Please examine your system log file (/var/log/messages or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.4, “MySQL Server Logs”.

- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.7, “How to Report Bugs or Problems”.

B.5.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.5.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See Section 6.2, “The MySQL Access Privilege System”, and Section 6.2.9, “Troubleshooting Problems Connecting to MySQL”.

B.5.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client

on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.9.2, “Starting the Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Connection to MySQL Server Failing on Windows.
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place

the socket file somewhere else. See Section B.5.3.6, “How to Protect or Change the MySQL Unix Socket File”.

- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

  ```
  shell> netstat -ln | grep mysql
  ```

  See Section B.5.3.6, “How to Protect or Change the MySQL Unix Socket File”.

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.

- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.

- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)

- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The

default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```

   This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.5.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

B.5.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.5.2.5 Host 'host_name' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. (See Section 5.1.5, “Server System Variables”.) After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command.

By default, `mysqld` blocks a host after 100 connection errors. You can adjust the value by setting `max_connect_errors` at server startup:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

The value can also be set at runtime:

```
mysql> SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.5.2.6 Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` or `SUPER` privilege. By granting the privilege to administrators and not to normal users (who should not need it), an administrator who also has the `PROCESS` privilege can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 13.7.5.29, “SHOW PROCESSLIST Syntax”.

The maximum number of connections MySQL supports depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at least 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to (open tables × 2 + open connections) < 2048 due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see Section 2.5, “Installing MySQL on Linux”, for how to raise the operating system limit on how many handles can be used by MySQL.

B.5.2.7 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.5.2.8 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
`CR_SERVER_GONE_ERROR`	The client couldn't send a question to the server.
`CR_SERVER_LOST`	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.5, “Server System Variables”.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

  The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

  The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.
- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 64MB (4MB before MySQL 8.0.3). You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.5.2.9, “Packet Too Large”.

  An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

  You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

  Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.
- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.

- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.

You can get more information about the lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See Section 5.4.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See Section 28.5, “Debugging and Porting MySQL”.
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.4.3, “The General Query Log”.)

See also Section B.5.2.10, “Communication Errors and Aborted Connections”, and Section 1.7, “How to Report Bugs or Problems”.

B.5.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 8.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB (4MB before MySQL 8.0.3). You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
shell> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.5.2.10 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See Section 5.4.2, “The Error Log”.
- The general query log. See Section 5.4.3, “The General Query Log”.
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See Section 5.1.7, “Server Status Variables”.
- The host cache, which is accessible using the `host_cache` Performance Schema table. See Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”, and Section 25.11.16.1, “The host_cache Table”.

If you start the server with the `log_error_verbosity` system variable set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See Section 5.1.5, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See Section 5.1.5, “Server System Variables”.

- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See Section B.5.2.9, “Packet Too Large”.
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also Section B.5.2.8, “MySQL server has gone away”.

B.5.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See Section C.10.3, “Limits on Table Size”.

B.5.2.12 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.6, “Using Option Files”.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.5.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.5.2.14 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

`Found wrong password for user '`*`some_user`*`'@'`*`some_host`*`'; ignoring user`

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

B.5.2.15 Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 13.7.5, “SHOW Syntax”.

B.5.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=`*`charset_name`* option. See Section 2.8.4, “MySQL Source-Configuration Options”.

  All standard MySQL binaries are compiled with support for all multibyte character sets.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

  In this case, you need to use one of the following methods to solve the problem:

  - Recompile the client with support for the character set. See Section 2.8.4, “MySQL Source-Configuration Options”.

- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.5.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23)`, `Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in Section 8.4.3.1, “How MySQL Opens and Closes Tables”. Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See Section 5.1.5, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.6, “Using Option Files”. If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.5.2.18 Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also Section 5.1.4, “Server Command Options”, and Section 28.5.1.7, “Making a Test Case If You Experience Table Corruption”.

B.5.3 Administration-Related Issues

B.5.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are `0640` and `0750`, respectively. MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because 0600 octal is 384 decimal.

To change the default `UMASK` value, start `mysqld_safe` as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

For additional details, see Section 4.9, “MySQL Program Environment Variables”.

B.5.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see Section 2.9.4, “Securing the Initial MySQL Account”.

If you know the `root` password and want to change it, see Section 13.7.1.1, “ALTER USER Syntax”, and Section 13.7.1.10, “SET PASSWORD Syntax”.

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

   ```
   ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
   ```
4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

   ```
   C:\> cd "C:\Program Files\MySQL\MySQL Server 8.0\bin"
   C:\> mysqld --init-file=C:\\mysql-init.txt
   ```

   If you installed MySQL to a different location, adjust the `cd` command accordingly.

   The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

   To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

   If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

   ```
   C:\> mysqld
           --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.0\\my.ini"
           --init-file=C:\\mysql-init.txt
   ```

   The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.
7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files,

and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

   Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

   ```
   shell> kill `cat /mysql-data-directory/host_name.pid`
   ```

   Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.
3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

   ```
   ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
   ```
4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.
5. Start the MySQL server with the special `--init-file` option:

   ```
   shell> mysqld --init-file=/home/me/mysql-init &
   ```

   The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

   Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before `--init-file`.
6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, you might want to use `--skip-grant-tables` in conjunction with `--skip-networking` to prevent remote clients from connecting. As of MySQL 8.0.3, if the server is started with the `--skip-grant-tables` option, the server enables `--skip-networking` automatically to prevent remote connections.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` and `--skip-networking` options).

B.5.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See Section 5.4.2, “The Error Log”.

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See Section 28.5, “Debugging and Porting MySQL”. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.
- Start `mysqld` with the general query log enabled (see Section 5.4.3, “The General Query Log”). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.4.3, “The General Query Log”. If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See Section 1.7, “How to Report Bugs or Problems”.
- Try to make a test case that we can use to repeat the problem. See Section 28.5, “Debugging and Porting MySQL”.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See Section 28.5, “Debugging and Porting MySQL”.
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:

  1. Start `mysqld` from `gdb` (or another debugger). See Section 28.5, “Debugging and Porting MySQL”.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

     ```
     backtrace
     info local
     up
     info local
     up
     info local
     ```

     With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *`N`* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.

- Send a normal bug report. See Section 1.7, “How to Report Bugs or Problems”. Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

  The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.
- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

B.5.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

B.5.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space. On replication slaves, you can use `--slave-load-tmpdir` to specify a separate directory for holding temporary files when replicating `LOAD DATA INFILE` statements.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (`:`) on Unix and semicolon characters (`;`) on Windows.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should be sure to set `--slave-load-tmpdir` not to point to a directory that is on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the slave temporary file directory are lost when the server restarts, replication fails.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `lsof +L1` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

In most cases, `ALTER TABLE` creates a temporary copy of the original table in the same directory as the original table.

Where InnoDB Stores Temporary Files

`InnoDB` temporary tables are stored in a temporary tablespace file named `ibtmp1`, which is located in the MySQL `data` directory (`datadir`) by default. The `innodb_temp_data_file_path` option can be used at startup to specify a different file name and location.

If an `ALTER TABLE` operation on an `InnoDB` table uses the `ALGORITHM=COPY` technique, `InnoDB` creates a temporary copy of the table in the same directory as the original table. Temporary table file names begin with an `#sql-` prefix and only appear briefly during the `ALTER TABLE` operation.

If an `ALTER TABLE` operation rebuilds an `InnoDB` table using the `ALGORITHM=INPLACE` technique (online DDL), `InnoDB` creates an *intermediate* copy of the table the same directory as the original table. Intermediate table file names begin with an `#sql-ib` prefix and only appear briefly during the `ALTER TABLE` operation.

`ALTER TABLE` operations that rebuild an `InnoDB` table using the `ALGORITHM=INPLACE` technique (online DDL) also create temporary sort files in the MySQL temporary directory (`$TMPDIR` on Unix, `%TEMP%` on Windows, or the directory specified by the `--tmpdir` configuration option). If the temporary directory is not large enough to hold such files, you may need to reconfigure `tmpdir`. Alternatively, you can define a separate temporary directory for `InnoDB` online `ALTER TABLE` operations using the `innodb_tmpdir` configuration option. This option was introduced to help avoid temporary directory overflows that could occur as a result of large temporary sort files created during

online `ALTER TABLE` operations. `innodb_tmpdir` can be configured dynamically using a `SET GLOBAL` or `SET SESSION` statement.

The `innodb_tmpdir` option is not applicable to intermediate table files, which are always created in the same directory as the original table.

In replication environments, only consider replicating an `innodb_tmpdir` setting if all servers have the same operating system environment. Otherwise, replicating an `innodb_tmpdir` setting could result in a replication failure when running online `ALTER TABLE` operations. If server operating environments differ, it is recommended that you configure `innodb_tmpdir` on each server individually.

For more information about online DDL, Section 15.12, “InnoDB and Online DDL”.

B.5.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

  ```
  [mysqld]
  socket=/path/to/socket

  [client]
  socket=/path/to/socket
  ```

  See Section 4.2.6, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.

- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.

- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See Section 2.8.4, “MySQL Source-Configuration Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.5.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 4.9, “MySQL Program Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

B.5.4 Query-Related Issues

B.5.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=, >, =, <, <=`, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `utf8mb4` and `utf8mb4_0900_ai_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with *`col_name`* `LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `utf8mb4` character set, you can use the `COLLATE` operator to cause either operand to have the `utf8mb4_0900_as_cs` or `utf8mb4_bin` collation:

```
col_name COLLATE utf8mb4_0900_as_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_0900_as_cs
col_name COLLATE utf8mb4_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE utf8mb4_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See Section 13.1.16, “CREATE TABLE Syntax”.

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET NAMES 'utf8mb4';
mysql> SET @s1 = 'MySQL' COLLATE utf8mb4_bin,
           @s2 = 'mysql' COLLATE utf8mb4_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0 |
+-----------+
mysql> SELECT @s1 COLLATE utf8mb4_0900_ai_ci = @s2;
+-------------------------------------+
| @s1 COLLATE utf8mb4_0900_ai_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
+--------------+
|            0 |
+--------------+
mysql> SELECT CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql';
+-------------------------------------------------------------------+
| CONVERT(@s USING utf8mb4) COLLATE utf8mb4_0900_ai_ci = 'mysql' |
+-------------------------------------------------------------------+
|                                                                 1 |
+-------------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-------------------------+----------------------+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See Section 12.5, “String Functions”.

B.5.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression

- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special "zero" date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` mode.

MySQL permits you to store a "zero" value of `'0000-00-00'` as a "dummy date." This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

B.5.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `''`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, “Working with NULL Values”, for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `''`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See Section 13.2.7, “LOAD DATA INFILE Syntax”.

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.5.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
```

```
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias `` `a` ``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

B.5.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 13.7.5.36, “SHOW TABLE STATUS Syntax”, and Section 13.7.5.10, “SHOW CREATE TABLE Syntax”.

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See Section 13.7.5.16, “SHOW ENGINES Syntax” for full details.

B.5.4.6 Deleting Rows from Related Tables

If the total length of the DELETE statement for related_table is more than 1MB (the default value of the max_allowed_packet system variable), you should split it into smaller parts and execute multiple DELETE statements. You probably get the fastest DELETE by specifying only 100 to 1,000 related_column values per statement if the related_column is indexed. If the related_column isn't indexed, the speed is independent of the number of arguments in the IN clause.

B.5.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with EXPLAIN to check whether you can find something that is obviously wrong. See Section 13.8.2, “EXPLAIN Syntax”.
2. Select only those columns that are used in the WHERE clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use LIMIT 10 with the query.
4. Issue a SELECT for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing FLOAT or DOUBLE columns with numbers that have decimals, you cannot use equality (=) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the FLOAT to a DOUBLE fixes this. See Section B.5.4.8, “Problems with Floating-Point Values”.
6. If you still cannot figure out what is wrong, create a minimal test that can be run with mysql test < query.sql that shows your problems. You can create a test file by dumping the tables with mysqldump --quick db_name *tbl_name_1 ... tbl_name_n* > query.sql. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your SELECT statement at the end of the file.

   Verify that the test file demonstrates the problem by executing these commands:

   ```
   shell> mysqladmin create test2
   shell> mysql test2 < query.sql
   ```

   Attach the test file to a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

B.5.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The FLOAT and DOUBLE data types are subject to these issues. For DECIMAL columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses DOUBLE to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
    -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
    -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
    -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
    -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
    -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
```

```
    -> FROM t1 GROUP BY i HAVING a <> b;

+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    1 |  21.4 | 21.4 |
|    2 |  76.8 | 76.8 |
|    3 |   7.4 |  7.4 |
|    4 |  15.4 | 15.4 |
|    5 |   7.2 |  7.2 |
|    6 | -51.4 |    0 |
+------+-------+------+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    6 | -51.4 |    0 |
+------+-------+------+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+------+------+------+
| i    | a    | b    |
+------+------+------+
|    1 | 21.4 | 21.4 |
|    2 | 76.8 | 76.8 |
|    3 |  7.4 |  7.4 |
|    4 | 15.4 | 15.4 |
|    5 |  7.2 |  7.2 |
+------+------+------+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

B.5.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

  `EXPLAIN` is discussed in more detail in Section 13.8.2, “EXPLAIN Syntax”.

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See Section 13.7.2.1, “ANALYZE TABLE Syntax”.

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Section 8.9.4, “Index Hints”.

- Global and table-level `STRAIGHT_JOIN`. See Section 13.2.10, “SELECT Syntax”.

- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.5, “Server System Variables”.

B.5.6 Table Definition-Related Issues

B.5.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.5.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.

- You cannot use `RENAME TABLE` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

  ```
  ALTER TABLE old_name RENAME new_name;
  ```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

  The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

  You can work around this issue if your query permits use of a common table expression (CTE) rather than a `TEMPORARY` table. For example, this fails with the `Can't reopen table` error:

```
CREATE TEMPORARY TABLE t SELECT 1 AS col_a, 2 AS col_b;
SELECT * FROM t AS t1 JOIN t AS t2;
```

  To avoid the error, use a `WITH` clause that defines a CTE, rather than the `TEMPORARY` table:

```
WITH cte AS (SELECT 1 AS col_a, 2 AS col_b)
SELECT * FROM cte AS t1 JOIN cte AS t2;
```

- The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.
- There are known issues in using temporary tables with replication. See Section 18.4.1.24, “Replication and Temporary Tables”, for more information.

B.5.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.1, “General Installation Guidance”, and Section 28.5, “Debugging and Porting MySQL”.

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=`*`old_host_name`*`-bin`. See Section 5.1.4, “Server Command Options”. Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See Section 4.6.8, “`mysqlbinlog` — Utility for Processing Binary Log Files”.
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- You cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE`

precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.

- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by `2`, **not** `1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

  An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
       WHERE userid = 9 ORDER BY id DESC;
```

  and

```
SELECT DISTINCT band_downloads.mp3id
       FROM band_downloads,band_mp3
       WHERE band_downloads.userid = 9
       AND band_mp3.id = band_downloads.mp3id
       ORDER BY band_downloads.id DESC;
```

  In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

  Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

C.1 Restrictions on Stored Programs

These restrictions apply to the features described in Chapter 23, *Stored Programs and Views*.

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some restrictions specific to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see Section 13.5, “Prepared SQL Statement Syntax”. Exceptions are `SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS`, which are not permissible as prepared statements but are permitted in stored programs.
- Because local variables are in scope only during stored program execution, references to them are not permitted in prepared statements created within a stored program. Prepared statement scope is the current session, not the stored program, so the statement could be executed after the

program ends, at which point the variables would no longer be in scope. For example, `SELECT ... INTO local_var` cannot be used as a prepared statement. This restriction also applies to stored procedure and function parameters. See Section 13.5.1, “PREPARE Syntax”.

- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See Section 13.2.10.1, “SELECT ... INTO Syntax”, and Section 13.6.6, “Cursors”.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors and are disallowed.

Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see Section 18.4.1.35, “Replication and Triggers”.
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database. Nor are they permitted on `INFORMATION_SCHEMA` or `performance_schema` tables. Those tables are actually views and triggers are not permitted on views.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in Section 23.7, “Binary Logging of Stored Programs”.

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

Debugging Considerations

There are no stored routine debugging facilities.

Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See Section 23.7, “Binary Logging of Stored Programs”.

Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug #16409, Bug #18896)
- DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)

C.2 Restrictions on Condition Handling

`SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS` are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class `'04'` are not treated specially. They are handled the same as other exceptions.

Standard SQL has a diagnostics area stack, containing a diagnostics area for each nested execution context. Standard SQL syntax includes `GET STACKED DIAGNOSTICS` for referring to stacked areas. MySQL does not support the `STACKED` keyword because there is a single diagnostics area containing information from the most recent statement that wrote to it. See also Section 13.6.7.7, “The MySQL Diagnostics Area”.

In standard SQL, the first condition relates to the `SQLSTATE` value returned for the previous SQL statement. In MySQL, this is not guaranteed, so to get the main error, you cannot do this:

```
GET DIAGNOSTICS CONDITION 1 @errno = MYSQL_ERRNO;
```

Instead, do this:

```
GET DIAGNOSTICS @cno = NUMBER;
GET DIAGNOSTICS CONDITION @cno @errno = MYSQL_ERRNO;
```

C.3 Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client

requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into an internal temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table when its size exceeds the minimum value of the `max_heap_table_size` and `tmp_table_size` system variables. The same restrictions apply to internal temporary tables created to hold the result set for a cursor as for other uses of internal temporary tables. See Section 8.4.4, “Internal Temporary Table Use in MySQL”. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

C.4 Restrictions on Subqueries

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

  Exception: The preceding prohibition does not apply if for the modified table you are using a derived table (subquery in the `FROM` clause) and that derived table is materialized rather than merged into the outer query. (See Section 8.2.2.3, “Optimizing Derived Tables, View References, and Common Table Expressions”.) Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS dt ...);
```

  Here the result from the derived table is materialized as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

  In general, you may be able to influence the optimizer to materialize a derived table by adding a `NO_MERGE` optimizer hint. See Section 8.9.2, “Optimizer Hints”.

- Row comparison operations are only partially supported:

  - For *`expr [NOT] IN subquery`*, *`expr`* can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples. The permitted syntax is therefore more specifically expressed as *`row_constructor [NOT] IN table_subquery`*

  - For *`expr op {ALL|ANY|SOME} subquery`*, *`expr`* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

  In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(expr_1, ..., expr_n) [NOT] IN table_subquery
```

But this is not supported:

```
(expr_1, ..., expr_n) op {ALL|ANY|SOME} subquery
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized in whole (evaluated to produce a result set) during query execution, so they cannot be evaluated per row of the outer query. The optimizer delays materialization until the result is needed, which may permit materialization to be avoided. See Section 8.2.2.3, “Optimizing Derived Tables, View References, and Common Table Expressions”.

- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
    ->   WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
 'LIMIT & IN/ALL/ANY/SOME subquery'
```

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is an extension to the SQL standard. In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

C.5 Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.

- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Section C.4, “Restrictions on Subqueries”.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.”

(This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist. For details, see Section 23.5.3, “Updatable and Insertable Views”.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS` *`alias_name`* clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

C.6 Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the *`bqual`* part of the *`xid`* value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

An XA transaction is written to the binary log in two parts. When `XA PREPARE` is issued, the first part of the transaction up to `XA PREPARE` is written using an initial GTID. A `XA_prepare_log_event` is used to identify such transactions in the binary log. When `XA COMMIT` or `XA ROLLBACK` is issued, a second part of the transaction containing only the `XA COMMIT` or `XA ROLLBACK` statement is written using a second GTID. Note that the initial part of the transaction, identified by `XA_prepare_log_event`, is not necessarily followed by its `XA COMMIT` or `XA ROLLBACK`, which can cause interleaved binary logging of any two XA transactions. The two parts of the XA transaction can even appear in different binary log files. This means that an XA transaction in `PREPARED` state is now persistent until an explicit `XA COMMIT` or `XA ROLLBACK` statement is issued, ensuring that XA transactions are compatible with replication.

The following restrictions exist for using XA transactions:

- XA is not fully crash-safe with respect to the binary log (on the master). If there is a crash before `XA PREPARE`, between `XA PREPARE` and `XA COMMIT` (or `XA ROLLBACK`), or after `XA COMMIT` (or `XA ROLLBACK`), the server and binary log are correctly recovered and taken to a consistent state. However, if there is a crash in the middle of the execution of one of these statements, the server may not be able to recover to a correct state, leaving the server state and the binary log in an inconsistent state.
- XA does not work with `relay-log-info-repository=TABLE`.
- XA does not work with replication filters or binary log filters. Filters are permitted as long as they do not render any XA transactions empty. Filters that filter out XA transactions may cause the slave to stop with an error.
- If GTIDs are enabled and the slave either does not use `--log-bin` or does not use `--log-slave-updates`, XA transactions are not crash-safe with respect to GTIDs on the slave. If the slave stops unexpectedly while applying an `XA PREPARE` or `XA COMMIT`, then after recovery `@@GLOBAL.GTID_EXECUTED` may not correctly describe the transactions that have been applied on the slave.
- `FLUSH TABLES WITH READ LOCK` is not compatible with XA transactions.
- XA transactions are considered unsafe for statement-based replication. If two XA transactions committed in parallel on the master are being prepared on the slave in the inverse order, locking dependencies can occur that cannot be safely resolved, and it is possible for replication to fail with deadlock on the slave. From MySQL 8.0.2, when `binlog_format=STATEMENT` is set, a warning is issued for DML statements inside XA transactions. When `binlog_format=MIXED` or `binlog_format=ROW` is set, DML statements inside XA transactions are logged using row-based replication, and the potential issue is not present.

Note

Prior to MySQL 5.7.7, XA transactions were not compatible with replication at all. This was because an XA transaction that was in `PREPARED` state would be rolled back on clean server shutdown or client disconnect. Similarly, an XA transaction that was in `PREPARED` state would still exist in `PREPARED` state in case the server was shutdown abnormally and then started again, but the contents of the transaction could not be written to the binary log. In both of these situations the XA transaction could not be replicated correctly.

C.7 Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.

- The `ucs2`, `utf16`, `utf16le`, and `utf32` character sets have the following restrictions:
  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 10.1.4, “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multibyte safe and may produce unexpected results with multibyte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

C.8 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Tables in the `performance_schema` database are not replicated.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

C.9 Restrictions on Pluggable Authentication

The first part of this section describes general restrictions on the applicability of the pluggable authentication framework described at Section 6.3.10, “Pluggable Authentication”. The second part describes how third-party connector developers can determine the extent to which a connector can take advantage of pluggable authentication capabilities and what steps to take to become more compliant.

The term “native authentication” used here refers to authentication against passwords stored in the `mysql.user` table. This is the same authentication method provided by older MySQL servers, before pluggable authentication was implemented. It remains the default method, although now it is implemented using plugins. “Windows native authentication” refers to authentication using the credentials of a user who has already logged in to Windows, as implemented by the Windows Native Authentication plugin (“Windows plugin” for short).

General Pluggable Authentication Restrictions

- **Connector/C, Connector/C++:** Clients that use these connectors can connect to the server only through accounts that use native authentication.

Exception: A connector supports pluggable authentication if it was built to link to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that version is installed, or if the connector is recompiled from source to link against the current `libmysqlclient`.

- **Connector/Net:** Clients that use Connector/Net can connect to the server through accounts that use native authentication or the Windows plugin.
- **Connector/PHP:** Clients that use this connector can connect to the server only through accounts that use native authentication, when compiled using the MySQL native driver for PHP (`mysqlnd`).
- **Windows native authentication:** Connecting through an account that uses the Windows plugin requires Windows Domain setup. Without it, NTLM authentication is used and then only local connections are possible; that is, the client and server must run on the same computer.
- **Proxy users:** Proxy user support is available to the extent that clients can connect through accounts authenticated with plugins that implement proxy user capability (that is, plugins that can return a user name different from that of the connecting user). For example, the native authentication plugins do not support proxy users, whereas the PAM and Windows plugins do.
- **Replication**: Replication slaves can employ not only master accounts using native authentication, but can also connect through master accounts that use nonnative authentication if the required client-side plugin is available. If the plugin is built into `libmysqlclient`, it is available by default. Otherwise, the plugin must be installed on the slave side in the directory named by the slave `plugin_dir` system variable.
- **`FEDERATED` tables:** A `FEDERATED` table can access the remote table only through accounts on the remote server that use native authentication.

Pluggable Authentication and Third-Party Connectors

Third-party connector developers can use the following guidelines to determine readiness of a connector to take advantage of pluggable authentication capabilities and what steps to take to become more compliant:

- An existing connector to which no changes have been made uses native authentication and clients that use the connector can connect to the server only through accounts that use native authentication. *However, you should test the connector against a recent version of the server to verify that such connections still work without problem.*

  Exception: A connector might work with pluggable authentication without any changes if it links to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that version is installed.

- To take advantage of pluggable authentication capabilities, a connector that is `libmysqlclient`-based should be relinked against the current version of `libmysqlclient`. This enables the connector to support connections though accounts that require client-side plugins now built into `libmysqlclient` (such as the cleartext plugin needed for PAM authentication and the Windows plugin needed for Windows native authentication). Linking with a current `libmysqlclient` also enables the connector to access client-side plugins installed in the default MySQL plugin directory (typically the directory named by the default value of the local server's `plugin_dir` system variable).

  If a connector links to `libmysqlclient` dynamically, it must be ensured that the newer version of `libmysqlclient` is installed on the client host and that the connector loads it at runtime.

- Another way for a connector to support a given authentication method is to implement it directly in the client/server protocol. Connector/Net uses this approach to provide support for Windows native authentication.

- If a connector should be able to load client-side plugins from a directory different from the default plugin directory, it must implement some means for client users to specify the directory. Possibilities for this include a command-line option or environment variable from which the connector can obtain the directory name. Standard MySQL client programs such as `mysql` and `mysqladmin` implement a `--plugin-dir` option. See also Section 27.7.13, “C API Client Plugin Functions”.
- Proxy user support by a connector depends, as described earlier in this section, on whether the authentication methods that it supports permit proxy users.

C.10 Limits in MySQL

This section lists current limits in MySQL 8.0.

C.10.1 Limits on Joins

The maximum number of tables that can be referenced in a single join is 61. This includes a join handled by merging derived tables (subqueries) and views in the `FROM` clause into the outer query block (see Section 8.2.2.3, “Optimizing Derived Tables, View References, and Common Table Expressions”). It also applies to the number of tables that can be referenced in the definition of a view.

C.10.2 Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of tables. The underlying file system may have a limit on the number of files that represent tables. Individual storage engines may impose engine-specific constraints. `InnoDB` permits up to 4 billion tables.

C.10.3 Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. For up-to-date information operating system file size limits, refer to the documentation specific to your operating system.

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

If you encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- You are using `InnoDB` tables and have run out of room in an `InnoDB` tablespace file. The maximum tablespace size is also the maximum size for a table. For tablespace size limits, see Section 15.8.1.7, “Limits on InnoDB Tables”.

  Generally, partitioning of tables into multiple tablespace files is recommended for tables larger than 1TB in size.
- You have hit an operating system file size limit. For example, you are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is permitted by the internal pointer size. `MyISAM` permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ($256^7 - 1$ bytes).

  If you need a `MyISAM` table that is larger than the default limit and your operating system supports large files, the `CREATE TABLE` statement supports `AVG_ROW_LENGTH` and `MAX_ROWS` options. See Section 13.1.16, “CREATE TABLE Syntax”. The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with `ALTER TABLE` to increase a table's maximum permissible size. See Section 13.1.7, “ALTER TABLE Syntax”.

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for `MyISAM` tables, set the `myisam_data_pointer_size`, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the `MAX_ROWS` option. The value of `myisam_data_pointer_size` can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`. See Section 13.7.5, “SHOW Syntax”, or Section 4.6.4, “`myisamchk` — MyISAM Table-Maintenance Utility”.

Other ways to work around file-size limits for `MyISAM` tables are as follows:

- If your large table is read only, you can use `myisampack` to compress it. `myisampack` usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See Section 4.6.6, “`myisampack` — Generate Compressed, Read-Only MyISAM Tables”.
- MySQL includes a `MERGE` library that enables you to handle a collection of `MyISAM` tables that have identical structure as a single `MERGE` table. See Section 16.7, “The MERGE Storage Engine”.

- You are using the `MEMORY` (`HEAP`) storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See Section 5.1.5, “Server System Variables”.

C.10.4 Limits on Table Column Count and Row Size

Column Count Limits

MySQL has hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact column limit depends on several factors:

- The maximum row size for a table constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. See Row Size Limits.
- The storage requirements of individual columns constrain the number of columns that fit within a given maximum row size. Storage requirements for some data types depend on factors such as storage engine, storage format, and character set. See Section 11.8, “Data Type Storage Requirements”.
- Storage engines may impose additional restrictions that limit table column count. For example, `InnoDB` has a limit of 1017 columns per table. See Section 15.8.1.7, “Limits on InnoDB Tables”. For information about other storage engines, see Chapter 16, *Alternative Storage Engines*.

Row Size Limits

The maximum row size for a given table is determined by several factors:

- The internal representation of a MySQL table has a maximum row size limit of 65,535 bytes, even if the storage engine is capable of supporting larger rows. `BLOB` and `TEXT` columns only contribute 9 to 12 bytes toward the row size limit because their contents are stored separately from the rest of the row.

- The maximum row size for an InnoDB table, which applies to data stored locally within a database page, is slightly less than half a page for 4KB, 8KB, 16KB, and 32KB innodb_page_size settings. For example, the maximum row size is slightly less than 8KB for the default 16KB InnoDB page size. For 64KB pages, the maximum row size is slightly less than 16KB. See Section 15.8.1.7, “Limits on InnoDB Tables”.

  If a row containing variable-length columns exceeds the InnoDB maximum row size, InnoDB selects variable-length columns for external off-page storage until the row fits within the InnoDB row size limit. The amount of data stored locally for variable-length columns that are stored off-page differs by row format. For more information, see Section 15.10, “InnoDB Row Storage and Row Formats”.

- Different storage formats use different amounts of page header and trailer data, which affects the amount of storage available for rows.

  - For information about InnoDB row formats, see Section 15.10, “InnoDB Row Storage and Row Formats”, and Section 15.8.1.2, “The Physical Row Structure of an InnoDB Table”.

  - For information about MyISAM storage formats, see Section 16.2.3, “MyISAM Table Storage Formats”.

Row Size Limit Examples

- The MySQL maximum row size limit of 65,535 bytes is demonstrated in the following InnoDB and MyISAM examples. The limit is enforced regardless of storage engine, even though the storage engine may be capable of supporting larger rows.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
       c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
       f VARCHAR(10000), g VARCHAR(6000)) ENGINE=InnoDB CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
       c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
       f VARCHAR(10000), g VARCHAR(6000)) ENGINE=MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

  In the following MyISAM example, changing a column to TEXT avoids the 65,535-byte row size limit and permits the operation to succeed because BLOB and TEXT columns only contribute 9 to 12 bytes toward the row size.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
       c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
       f VARCHAR(10000), g TEXT(6000)) ENGINE=MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

  The operation succeeds for an InnoDB table because changing a column to TEXT avoids the MySQL 65,535-byte row size limit, and InnoDB off-page storage of variable-length columns avoids the InnoDB row size limit.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
       c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
       f VARCHAR(10000), g TEXT(6000)) ENGINE=InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

- Storage for variable-length columns includes length bytes, which are counted toward the row size. For example, a VARCHAR(255) CHARACTER SET utf8mb3 column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

The statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
       (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
       ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The statement to create table `t2` fails because, although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
       (c1 VARCHAR(65535) NOT NULL)
       ENGINE = InnoDB CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

```
mysql> CREATE TABLE t2
       (c1 VARCHAR(65533) NOT NULL)
       ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.01 sec)
```

- For `MyISAM` tables, `NULL` columns require additional space in the row to record whether their values are `NULL`. Each `NULL` column takes one bit extra, rounded up to the nearest byte.

  The statement to create table `t3` fails because `MyISAM` requires space for `NULL` columns in addition to the space required for variable-length column length bytes, causing the row size to exceed 65,535 bytes:

  ```
  mysql> CREATE TABLE t3
         (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
         ENGINE = MyISAM CHARACTER SET latin1;
  ERROR 1118 (42000): Row size too large. The maximum row size for the used
  table type, not counting BLOBs, is 65535. This includes storage overhead,
  check the manual. You have to change some columns to TEXT or BLOBs
  ```

  For information about `InnoDB` `NULL` column storage, see Section 15.8.1.2, “The Physical Row Structure of an InnoDB Table”.

- `InnoDB` restricts row size (for data stored locally within the database page) to slightly less than half a database page for 4KB, 8KB, 16KB, and 32KB `innodb_page_size` settings, and to slightly less than 16KB for 64KB pages.

  The statement to create table `t4` fails because the defined columns exceed the row size limit for a 16KB `InnoDB` page.

  ```
  mysql> CREATE TABLE t4 (
         c1 CHAR(255),c2 CHAR(255),c3 CHAR(255),
         c4 CHAR(255),c5 CHAR(255),c6 CHAR(255),
         c7 CHAR(255),c8 CHAR(255),c9 CHAR(255),
         c10 CHAR(255),c11 CHAR(255),c12 CHAR(255),
         c13 CHAR(255),c14 CHAR(255),c15 CHAR(255),
         c16 CHAR(255),c17 CHAR(255),c18 CHAR(255),
         c19 CHAR(255),c20 CHAR(255),c21 CHAR(255),
         c22 CHAR(255),c23 CHAR(255),c24 CHAR(255),
         c25 CHAR(255),c26 CHAR(255),c27 CHAR(255),
         c28 CHAR(255),c29 CHAR(255),c30 CHAR(255),
         c31 CHAR(255),c32 CHAR(255),c33 CHAR(255)
  ```

```
       ) ENGINE=InnoDB ROW_FORMAT=DYNAMIC DEFAULT CHARSET latin1;
ERROR 1118 (42000): Row size too large (> 8126). Changing some columns to TEXT or BLOB may help.
In current row format, BLOB prefix of 0 bytes is stored inline.
```

C.10.5 Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

  On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

  When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

  This facility is often used to move the data and index files to a RAID or other fast solution.

- **Limited number of ports**

  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

  For more information about this problem, see http://support.microsoft.com/default.aspx?scid=kb;en-us;196271.

- **`DATA DIRECTORY` and `INDEX DIRECTORY`**

  The `DATA DIRECTORY` option for `CREATE TABLE` is supported on Windows only for `InnoDB` tables, as described in Section 15.7.5, “Creating File-Per-Table Tablespaces Outside the Data Directory”. For `MyISAM` and other storage engines, the `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows and any other platforms with a nonfunctional `realpath()` call.

- **`DROP DATABASE`**

  You cannot drop a database that is in use by another session.

- **Case-insensitive names**

  File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Section 9.2.2, “Identifier Case Sensitivity”.

- **Directory and file names**

  On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
```

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The `\` path name separator character**

  Path name components in Windows are separated by the `\` character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with `/` characters:

  ```
  mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
  ```

  Alternatively, you must double the `\` character:

  ```
  mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
  ```

- **Problems with pipes**

  Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z` / `CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

  This is mainly a problem when you try to apply a binary log as follows:

  ```
  C:\> mysqlbinlog binary_log_file | mysql --user=root
  ```

  If you have a problem applying the log and suspect that it is because of a `^Z` / `CHAR(24)` character, you can use the following workaround:

  ```
  C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
  C:\> mysql --user=root --execute "source /tmp/bin.sql"
  ```

  The latter command also can be used to reliably read in any SQL file that may contain binary data.
